ACKNOWLEDGEMENTS

We wish to thank Charles C. Davis, David L. Mackas and Ralph O. Brinkhurst for their assistance and cooperation during the course of this study. We would also like to thank Patricia M. Kimber, Margaret Frank, Sus Tabata, Brian M. Watt, and Ken R. Holman for their advice and help with the illustrations.

Preparation of this manual was made possible by Government of Canada funding (DSS Contract 05SB-FP833-0-1758) through the Department of Fisheries and Oceans, Institute of Ocean Sciences, Sidney, B.C. to E.V.S. Consultants Ltd. The authors wish to express their appreciation to the staff of E.V.S. Consultants Ltd. and particularly to Deedee Kathman and Peter M. Chapman who undertook supervision of this project.

We would also like to thank Marla K. Mees for her patience and care in preparing the draft and final manuscript.

This publication contains a complete species list of 121 pelagic marine Calanoida, Cyclopoida, Monstrilloida and Harpacticoida reported from the net zooplankton (i.e. species retained by a mesh size of ca. 335 μm) of British Columbia waters.

Part I is an identification manual with a tabular key, genera and species descriptions and species illustrations. Species descriptions summarize synonymies, morphology, reported global and local distribution, known life history information and major references. Information on ecology and present taxonomic status is included where appropriate.

Part II is a bibliography presented in two sections. Section I is an annotated bibliography to the literature dealing with the taxonomy and juvenile development of the copepods listed in the identification manual. The annotated section has a separate index. Section II presents taxonomic references that are not readily accessible and ancillary references on distributional and ecological topics.

RÉSUMÉ

Cette publication contient une liste complète des 121 Calanoida, Cyclopoida, Monstrilloida et Harpacticoida marins pélagiques trouvés dans le zooplancton tamisé (c.-à-d. les espèces retenues par un vide de maille d'environ 335 μm) des eaux côtières de la Colombie-Britannique.

La 1ère partie est un manuel d'identification comprenant une clé, description des genres et des espèces et illustrations des espèces. La description des espèces inclut synonymes, morphologie, distribution globale et locale, cycle biologique connu et principales références. Au besoin, on donne une information sur l'écologie et la position taxonomique actuelle.

La 2ème partie contient une bibliographie présentée en deux sections. La première est une bibliographie annotée des travaux publiés sur la taxonomic et le développement des jeunes copépodes mentionnés dans le manuel d'identification. Cette section a son propre index. La seconde contient des références taxonomiques qui ne sont pas facilement accessibles ainsi que des références supplémentaires sur la distribution et l'écologie.
PART I

AN IDENTIFICATION MANUAL
1.0 INTRODUCTION

This manual contains the first comprehensive key to marine planktonic copepods found in British Columbia coastal waters. The manual is designed for the technically oriented user with little expertise in copepod systematics, but also incorporates extensive reference information valuable to researchers already familiar with local species.

Restricting the key to local coastal waters reduces the number of species that must be included. Although identification of some of these species still requires the examination of dissected body parts, identification to genus and often to species can in many cases be based solely on gross morphological characteristics. With practice, almost all copepod species commonly encountered in the zooplankton of British Columbia coastal waters can be differentiated without dissection.

Background

Zooplankton research on this coast has been limited by the lack of any single reference for the accurate identification of marine copepods. The commonly used keys have been Brodsky (1950) and Davis (1949). Brodsky's (1950) extensive work addresses the whole of the North Pacific Ocean, and although Davis (1949) focuses on the northeastern Pacific, both these keys have become somewhat dated due to subsequent changes in generic and specific definitions, redescriptions of many species, and new records of species distribution.

Fulton (1972) produced a working key to local copepods which was intentionally oversimplified and restricted to copepods found in the Strait of Georgia. However, it has been extremely valuable to those working with British Columbia marine zooplankton.
The present manual and its associated bibliography combine all taxonomic literature pertinent to British Columbia marine copepods to provide a comprehensive key to the known free-swimming species in British Columbia waters. The occurrence of a number of reported species in this geographical area requires substantiation. Several species recorded by Wilson (1950) have not been observed by subsequent investigators, while other identifications given by this author are of questionable validity (C.C. Davis pers. comm.; C.T. Shih, pers. comm.) (see also Shih et al., 1971). Species whose occurrence in coastal British Columbia waters could not be verified have been omitted from the manual. These species are listed in Table I. The format of the key allows updating with minimal revision as zooplankton sampling programs are expanded and extended into new geographical areas (e.g. the coastal waters west of Vancouver Island, Dixon Entrance, and certain coastal fjords).

**Geographic Limits**

The key applies to copepods found in the nearshore area extending from Dixon Entrance in the north to the Strait of Juan de Fuca in the south, and includes all major coastal inlets studied to date (Fig. 1). Major nearshore areas of the continental shelf, such as Queen Charlotte Sound, are also included.

**Methodology**

Species described herein have either been collected and identified at the Ocean Ecology Laboratory (Institute of Ocean Sciences, Sidney, B.C.) or previously recorded from the area (e.g. Fulton, 1972; Stone, 1977; Chester et al., 1980). Oceanic species occasionally recorded in nearshore areas following intrusions of oceanic water (e.g. Stone, 1980; Gardner, 1982a, 1982b) have also been included, and are described from the literature.
Fig. 1. Geographical limits of British Columbia coastal waters as defined by the authors.
Table 1: Species reported from only a single collection taken from the study area, and for which identifications cannot be confirmed. These species have been omitted from the key.

</table>
Every attempt has been made to include all species reported from the study area. However, the paucity of zooplankton sampling in some areas (e.g. the entire continental shelf west of Vancouver Island until recently) imposes limitations on the scope of the manual. Because there is a strong probability of additional species (e.g. new species or range extensions) being found in the study area in the future, the key is constructed to allow easy insertion of additional descriptions.

Many of the genera included in the key are in need of revision (e.g. Pseudocalanus, Acartia). However, our primary intent was not to resolve taxonomic questions but to provide a simple effective key to local species as they are currently defined. Areas where more detailed taxonomic study is required or is underway are indicated.

In many species of free living Copepoda it is possible to recognize the basic morphology of the adult (or CVI stage) at the CV stage and, to a lesser extent, at the CIV stage. Because species of copepods may spend up to eight months as CV copepodites (see Fulton, 1973) the specific identification of these stages may be of great importance to ecological studies. When possible, the key presented in this manual has been designed to permit identification of CVI, CV, and usually CIV stage copepodites.

For each species included in the key we have presented recognized synonyms used in establishing records from British Columbia coastal waters. Additionally, synonyms recognized in major taxonomic studies are also included.

**Copepod Morphology and Systematics**

The taxonomic status of the Copepoda varies with the classification system used, ranging from class to subclass to order. Similarly, seven to nine orders (or sub-orders) are defined within the Copepoda. We consider Copepoda to be a class, a view adopted by several authors (e.g.
Kastner, 1970; George and George, 1979) and supported by the recent phylogenetic studies of Manton (1973, 1977). This manual deals only with the four orders containing species whose free living adults are pelagic: the Calanoida, Cyclopoida, Harpacticoida, and Monstrilloidea. Of these the Calanoida is the best known order and is usually dominant in marine plankton. Cyclopoids are less well known and are primarily benthic, but have several planktonic genera. Harpacticoids are almost exclusively benthic, with only two species commonly found in the local plankton. Monstrilloids are highly modified, with a free-swimming adult and larval stages that are internal parasites of polychaetes and molluscs.

Because the majority of the pelagic, marine copepods found in British Columbia waters are calanoids, the basic morphology of members of this order will be described in some detail. The other orders will be described briefly, with discussion of differences among the four orders. Although morphological terminology varies in the literature, the predominant names were selected to provide uniformity, and alternate systems are shown for purposes of comparison (Fig. 2).

The morphology of calanoid copepods is typified by the adult of the genus Calanus (Fig. 2). The body is segmented, with a single articulation dividing the prosome (Pro) from the urosome (Ur). The prosome is composed of a head region (Hd) followed by three to five thoracic segments (Th1-Th5), with the first complete segment always called the Th1. As a result of the fusion of the head and first thoracic segment the first pair of swimming legs (Pl) originates within the head region. Similarly, the presence of two sets of swimming legs within the last thoracic segment is a result of the fusion of segments, common in calanoids and cyclopoids.
Calanoid morphological terminology.

from Owre and Foyo, 1967

Differences in calanoid morphological terminology.

from Owre and Foyo, 1967
Posterior to the articulation lies a slender urosome (Ur), which bears no swimming appendages. The number of segments in the urosome varies with life history stage and sex. Its proximal and distal segments are modified, with the proximal containing the genital pore and referred to as the genital segment (gns gt). In females the genital segment is composed of two fused segments and bears one or more ventral symmetrical or asymmetrical protuberances, the number and arrangement of which are usually genera or species specific. In males, the genital segment is short, unfused, and possesses a smooth ventral surface which is of little taxonomic significance. The anal segment (ansgt), the most distal segment of the urosome, bears the anus. On the posterior margin of the anal segment two single segmented caudal rami (Cr) are attached. Each bears four or five long, stout setae with secondary (and occasionally tertiary) setules. The caudal rami may have small setae along their medial margins. The urosomal segments, located between the genital and anal segments, are numbered sequentially. Females typically have a total of four urosomal segments (gns gt, Ur 1, Ur 2, ansgt) and males have five (gns gt, Ur 1, Ur 2, Ur 3, ansgt).

The shapes of the prosome and urosome are often characteristic. For example, some Calanus species can be separated by head profile (prosome) differences. The head may or may not bear a rostrum (Ro), which is often of characteristic shape. Many species have characteristic spines or blunt processes at the posterior corners of the prosome, while in others the caudal rami may differ in length, shape or armature.

Several paired appendages are identifiable (Figs. 2, 3). These appendages normally have the same basic structure in all calanoids, but differ in minor characteristics which commonly are diagnostic of different genera or species. The most anterior paired appendages are the first
Generalized copepod body shapes.

from Sars, 1921; Owre and Foyo, 1967

Calanoid appendages (not drawn to scale).

antennae (A1), which may vary between species in number of segments, arrangement of setae on the segments, and relative length. The second antennae (A2), mandibles (md), first maxillae (max1), second maxillae (max2) and maxillipeds (mxp) complete the head appendages, and are often collectively termed feeding appendages as they all contribute to food gathering and processing.

The thorax bears up to five paired swimming legs (P1-P5) with each leg having two basal segments, the basipodites (bpl, bp2). The distal basipodite carries two rami, an outer exopodite (exp) and an inner endopodite (enp), each consisting of a variable number of segments depending on species and life history stage. The morphology of the fifth pair of legs varies considerably, being frequently absent in some females, and always dissimilar in males and females of the same species. When present, the P5's may be uniramous, biramous, or occasionally chelate in males. Younger stages do not have all the swimming legs (e.g. Table 2).

* P5 of CV and CVI females often absent in other genera, allowing easier recognition of sexes in these stages.
Differentiation between species is often based on the armature of the appendages. Armature may include such characters as teeth, spines, spinules, blades, setae, and setules (see Glossary). The function of the appendages is discussed by Marshall and Orr (1955), Brodsky (1950), Marshall (1973) and others.

The other orders included in this manual are readily separable from the Calanoida. Cyclopoid copepods have a relatively broad prosome and a narrow urosome. The A1 are usually shorter than the prosome, and the A2 are uniramous, resulting in a jerky swimming motion. The articulation is not as distinct as in the calanoids, and lies between Th4 and Th5, with the result that the P5 are carried on the first segment posterior to the articulation, and may be reduced and difficult to see. The female often carries eggs in two ovisacs located externally on either side of the genital segment.

Harpacticoids have a biramous A2 (as do calanoids) but the major articulation between Th4 and Th5 (as in cyclopoids) is much less distinct and the urosome is often as broad as the prosome. The A1 are much reduced, being composed of nine or fewer segments, and is typically shorter than the head region. Eggs are usually contained in a single ovisac carried medially on the genital segment.

Monstrilloids are the most highly modified copepod order found in the plankton. The adults are non-feeding and all appendages between the A1 and P1 are lacking. The A1 are usually short and project forward. The major articulation is not pronounced.
Copepod Life Histories

Copepods commonly appear in samples as juvenile stages and the differentiation and identification of species by life history stage can be difficult. A generalized life history of copepods which will assist in identifications is provided below. More complete information may be found in Marshall and Orr (1955) or in advanced texts in invertebrate zoology.

Development proceeds from an egg, which may be single or part of a cluster, through six successive naupliar stages (NI-NVI) (Fig. 4). In some species, earlier naupliar stages occur within the egg, but in others the NI is free-swimming. The sixth nauplius metamorphoses into the first copepodite stage (CI), which is similar to the adult but commonly has only two pairs of legs and one or two abdominal segments. Molting continues through a series of copepodite stages to the sixth and final stage, the adult (CVI) (Fig. 5). Males and females can be distinguished in the CVI by the number and extent of development of the urosomal segments and the degree of development of the P5. The absence of the P5 in some CV and even CIV is a confirmatory female characteristic.

Although most nauplii are poorly known, their relative stage may be established by shape, size, and presence or absence of certain appendages. Species identification solely from nauplii has rarely been attempted, although Faber (1966) presented a key to the nauplii of 14 species found in Narragansett Bay, Rhode Island.

Copepodite stages are typically recognized by the number of segments in the uroscope and the number of pairs of swimming legs (e.g. Table 2). These numbers are not constant for all species, but variations are minor. Fulton (1972) tabulates the size, number of pairs of legs, and number of urosomal segments for nine common calanoid species. The developmental patterns of marine cyclopoids and harpacticoids are thought to follow the same general pattern.
Naupliar stages in *Tortanus*

from Gurney, 1934; Johnson, 1942; Bernard, 1965; Lawson and Grice, 1970
Fig. 5

Copepodite stages in *Bradydius*.

from Shih et al., 1981
Regardless of order, adult males and females of the species included in this manual can usually be distinguished by a few salient features. In addition to differences in number of urosomal segments and pairs of swimming legs (see Table 2), adult females may often be recognized by the presence of an elongate or robust gnsgt bearing one to several ventral protuberances and by the presence of spermathecae or ovisacs. Adult males occasionally have a bulbous and/or articulate Al on either or both sides.

Generation time and growth rate vary considerably among species. In some species, the females produce several egg clutches in less than a week, other species lay only a single clutch, while others lay a series of single eggs before dying. Life spans range from one week to two years (see, for example, Digby, 1954; Heinle, 1966). In general, smaller species (e.g. Pseudocalanus spp., Oithona spp.) tend to be shorter-lived, producing several successive generations annually, while larger copepods (e.g. Calanus spp., Neocalanus spp.) tend to live longer, often having annual life cycles (see Campbell, 1934; Fulton 1973).

**Format and Use**

The manual consists of a key to species followed by detailed species descriptions. Descriptions include pertinent illustrations, synonymies, major references, size ranges, ecological information on dominant species, and information on life history stages as available. An extensive ancillary list of references relevant to local copepod species has been included as a separate bibliography (see Part II).

Figures used in the species descriptions were obtained from various published sources and are drawn in standardized format. As far as possible, each figure consists of a basic set of drawings including dorsal and lateral views of the adult male and female, all female swimming
legs (P1-P4), and fifth legs (P5) of both the adult male and female. Where possible, illustrations of feeding appendages have been included when these appendages have been used to distinguish taxa. To indicate their relative sizes, the first antennae (A1) and P5 are often included in lateral view of entire specimens, but all other appendages are omitted. Other drawings, such as an enlarged view of the urosome or genital segment, are included where appropriate. Separate body parts are drawn in ventral view unless otherwise indicated. In the upper left of each figure, a 1.0 mm scale bar is provided which refers only to drawings of whole specimens, not to individually figured appendages.

The key is initiated by separating the free-swimming copepods into orders. Harpacticoida and Monstrilloida are the smallest orders, being represented by only a few species occurring in the local zooplankton. The order Cyclopoida is considerably larger, and includes some species which are occasionally abundant in the plankton. The fourth order, Calanoida, constitutes the bulk of nearshore zooplankton and comprises the largest taxonomic section.

Before using the manual, it is advisable to become familiar with the scope and format of the tabular key. To identify a specimen, try to establish the sex and, if possible, the developmental stage (see Table 2). Although not essential, this will facilitate use of the tabular key.

Species identification is based upon a series of key groups (KG's). Each key group contains characters describing the specimens being examined. By selecting the correct characters, it is possible to establish a character sequence, analogous to a 'formula' describing the specimen. This character sequence is then compared with a list of all possible character sequences given on the same page and a matching sequence identified. This matching sequence will direct you to another KG which may immediately identify the specimen or, more likely, present you
with another level of characters. Following successive KG's will eventually provide a tentative species identification which must be confirmed by comparison of the specimen with the generic and species description.

Three general symbols are used in the key. A '+' symbol indicates that any of the alternative answers are correct for a particular character; '?' indicates unknown; and '#' indicates that the character does not apply in this case.

The following example will clarify the use of a tabular key. Assume you are starting with an adult copepod of unknown order:

1) Go to KG1

Using the list of characters, we find that our specimen has five pairs of cephalic appendages, a short A1 with 12-15 segments, a uniramous A2 and a narrow urosome. This gives us a character sequence of 'y + u n', corresponding to the second character sequence listed in KG1. The '+' symbol in the key indicates that any of the alternative answers for character II are correct. This sequence sends us to KG 4, Cyclopoida.

2) Go to KG4

Our specimen has an elongate prosome, elongate urosome, short A1, lacks cuticular lenses, and has a three-segmented exp and enp in the P4, for a character sequence of 'e l s n 3-3', corresponding to the fourth character sequence, which sends us to KG 20. Note that in this case, the second character, urosome length, is not relevant to the selection of the correct key group.
3) Go to KG 20

Here, there are only three characters. Our specimen has a seta on the distal inner margin of the P2 bp1, has two spines on the P2 exp3 and has a short gnsgt. This character sequence conforms to Lubbockia wilsonae.

Once a tentative identification is made, the species description in the second part of the key must be considered for verification. If a discrepancy exists which cannot be attributed to difference in stage or sex, the process of identification must be repeated. Some alternative character states may initially be difficult to differentiate, however the generic descriptions indicate morphologically similar species which may be confused.

Summary

This manual includes all calanoid, cyclopoid, and monstrilloid copepods, as well as the only two common planktonic harpacticoids, reported from the study area to date. It is expected that the species list will increase with more intensive sampling of such areas as coastal fjords and the northernmost sections of the British Columbia coast. The use of nets with small mesh size will permit better collections of smaller copepods and younger life history stages which are presently undersampled. The use of different types of sampling gear will increase our knowledge of specialized environments such as the suprabenthos and the neuston, both of which have not been extensively studied. The additional new species will be incorporated in revisions of the manual.
Present taxonomic keys generally rely on adult characteristics. We have, whenever possible, selected characters relevant to juvenile as well as adult specimens, verifying the relevance of chosen characters to juveniles where juvenile stages have been described. This manual is designed to evolve in relation to our increasing knowledge of marine zooplankton communities and can incorporate new life history data for local species as such information becomes available.

Glossary

aesthetasc  
elongate sensory setae often found on the first antennae

anal segment (ansgt)  
terminal segment of urosome, often reduced, which bears the anal pore

antennae (A1, A2)  
movable, paired, segmented sensory and locomotory organs on head

apical  
at, near, or pertaining to the apex

armature  
protective, sometimes spinous projections of the cuticle

articulation  
movable joint or plate where two parts or segments are joined

basipodite (bp)  
first one or two proximal segments of a biramous appendage

bifid  
divided into two

blade  
broad, flat structure; modified spine

bristle  
short, stiff hair

carapace  
hard cuticular shell covering the body

caudal rami (Cr)  
a pair of one-segmented appendages attached to the ansgt and bearing the caudal setae

cephalic  
pertaining to the head region

cephalosome  
head region

SPECIES LIST

Order Harpacticoida

Family Ectinosomidae

1.1.1 Microsetella norvegica (Boeck, 1864)
1.1.2 M. rosea (Dana, 1852)

Order Monstrilloida

Family Monstrillidae

2.1.1 Monstrilla canadensis McMurrich, 1917
2.1.2 M. helgolandica Claus, 1863
2.1.3 M. longiremis Giesbrecht, 1892
2.1.4 M. spinosa Park, 1967
2.1.5 M. wandelli Stephensen, 1913

Order Cyclopoida

Family Ascomyzontidae

3.1.1 Ascomyzon rubrum Campbell, 1929

Family Corycaeidae

4.1.1 Corycaeus anglicus Lubbock, 1857
4.1.2 C. catus Dahl, 1894

Family Lichomolgidae

5.1.1 Macrocheiron sargassi Sars, 1916

Family Oithonidae

6.1.1 Oithona similis Claus, 1863
6.1.2 O. spinirostris Claus, 1863

Family Oncaeidae

7.1.1 Oncaea borealis Sars, 1918
7.1.2 O. conifera Giesbrecht, 1891
7.1.3 O. Englishi Heron, 1977
7.1.4 O. ivlevi Shmeleva, 1966
7.1.5 O. prolata Heron, 1977
7.2.1 Lubbockia minuta Wolfenden, 1905
7.2.2 L. wilsonae Heron and Damkaer, 1969
7.3.1 Pseudolubbockia dilatata Sars, 1909
Order Calanoida

Family Calanidae

8.1.1  *Calanus marshallae* Frost, 1974
8.1.2  *C. pacificus s.l.* Brodsky, 1948
8.1.1  *Neocalanus cristatus* (Kroyer, 1848)
8.1.1  *N. plumchrus* (Marukawa, 1921)
8.1.1  *Mesocalanus tenuicornis* (Dana, 1849)

Family Eucalanidae

9.1.1  *Eucalanus bungii* Giesbrecht, 1892
9.1.2  *E. californicus* Johnson, 1938
9.1.3  *E. hyalinus* (Claus, 1866)
9.2.1  *Rhincalanus nasutus* Giesbrecht, 1888

Family Calocalanidae

10.1.1  *Mecynocera clausi* Thompson, 1888
10.2.1  *Calocalanus styliremis* Giesbrecht, 1888

Family Paracalanidae

11.1.1  *Paracalanus parvus* (Claus, 1863)

Family Pseudocalanidae

12.1.1  *Pseudocalanus cf. minutus* (Kroyer, 1845)
12.2.1  *Microcalanus pygmaeus pusillus* Sars, 1903
12.3.1  *Clausocalanus arcuicornis* (Dana, 1849)
12.3.2  *C. lividus* Frost and Fleminger, 1968
12.3.3  *C. parapergens* Frost and Fleminger, 1968
12.4.1  *Ctenocalanus vanus* Giesbrecht, 1888

Family Spinocalanidae

13.1.1  *Spinocalanus brevicaudatus* Brodsky, 1950
13.1.2  *S. horridus* Wolfenden, 1911
13.1.3  *S. longicornis* Sars, 1900

Family Aetideidae

14.1.1  *Aetideus divergens* Bradford, 1971
14.1.2  *A. pacificus* Brodsky, 1950
14.2.1  *Bradyidius saanich* Park, 1966
14.2.2  *B. similis* (Sars, 1903)
14.3.1  *Chiridius gracilis* Farran, 1908
14.3.2  *C. polaris* Wolfenden, 1911
14.4.1  *Gaidus minutus* Sars, 1907
14.4.2  *G. pungens* Giesbrecht, 1895
14.4.3  *G. variabilis* Brodsky, 1950
14.5.1 Gaetanus intermedius Campbell, 1930
14.5.2 G. miles Giesbrecht, 1888
14.5.3 G. pileatus Farran, 1903
14.6.1 Euchirella curticauda Giesbrecht, 1888
14.6.2 E. pulchra (Lubbock, 1856)
14.6.3 E. pseudopulchra Park, 1976
14.6.4 E. rostrata (Claus, 1866)
14.7.1 Chirundina streetsi Giesbrecht, 1895
14.8.1 Undeuchaeta bispinosa Esterly, 1911
14.9.1 Pseudochirella polypina Brodsky, 1950
14.10.1 Azygokeras columbiæ Koeller and Littlepage, 1976

Family Euchaetidae

15.1.1 Euchaeta californica Esterly, 1906
15.1.2 E. elongata Esterly, 1913
15.1.3 E. media Giesbrecht, 1888
15.1.4 E. spinosa Giesbrecht, 1892

Family Phanennidae

16.1.1 Onchocalanus magnus (Wolfenden, 1906)

Family Scolecithricidae

17.1.1 Scottocalanus persecans (Giesbrecht, 1895)
17.2.1 Lophothrix frontalis Giesbrecht, 1895
17.3.1 Scaphocalanus affinis (Sars, 1905)
17.3.2 S. brevicornis Sars, 1900
17.3.3 S. echinatus Farran, 1905
17.3.4 S. magnus (T. Scott, 1894)
17.3.5 S. major (T. Scott, 1894)
17.3.6 S. subbrevicornis (Wolfenden, 1911)
17.4.1 Racovitzanus antarcticus Giesbrecht, 1902
17.5.1 Scolecithricella emarginata (Farran, 1905)
17.5.2 S. minor (Brady, 1883)
17.5.3 S. subdentata (Esterly, 1905)
17.5.4 S. ovata (Farran, 1905)

Family Tharybidae

18.1.1 Tharybis fultoni Park, 1967

Family Temoridae

19.1.1 Eurytemora affinis (Poppe, 1880)
19.1.2 E. americana Williams, 1906
19.1.3 E. pacifica Sato, 1913
Family Metridiidae

20.1.1 Metridia curticauda Giesbrecht, 1889
20.1.2 M. lucens s.l. Boeck, 1864
20.1.3 M. okhotensis Brodsky, 1950
20.1.4 M. pacifica Brodsky, 1950
20.1.5 M. princeps Giesbrecht, 1889
20.2.1 Pleuromamma abdominalis (Lubbock, 1856)
20.2.2 P. borealis (Dahl, 1893)
20.2.3 P. quadrungulata (Dahl, 1893)
20.2.4 P. robusta (Dahl, 1893)
20.2.5 P. scutullata Brodsky, 1950
20.2.6 P. xiphias (Giesbrecht, 1889)
20.3.1 Gaussia princeps (T. Scott, 1894)

Family Centropagidae

21.1.1 Centropages abdominalis Sato, 1913

Family Lucicutiidae

22.1.1 Lucicutia bicornuta Wolfenden, 1905
22.1.2 L. flavicornis (Claus, 1863)
22.1.3 L. ovalis (Giesbrecht, 1889)

Family Heterorhabdidae

23.1.1 Heterorhabdus clausi (Giesbrecht, 1889)
23.1.2 H. papilliger (Claus, 1863)
23.1.3 H. robustoides Brodsky, 1950
23.1.4 H. robustus Farran, 1908
23.1.5 H. spinifrons (Claus, 1863)
23.1.6 H. tanneri (Giesbrecht, 1895)
23.2.1 Heterostylites longicornis (Giesbrecht, 1889)
23.2.2 H. major (Dahl, 1894)

Family Augaptilidae

24.1.1 Centraugaptilus porcellus Johnson, 1936
24.2.1 Haloptilus oxycephalus (Giesbrecht, 1889)
24.3.1 Pachyptilus pacificus Johnson, 1936

Family Arietellidae

25.1.1 Arietellus plumifer Sars, 1905
25.2.1 Phyllopus integer Esterly, 1911

Family Candaciidae

26.1.1 Candacia bipinnata (Giesbrecht, 1889)
26.1.2 C. columbae Campbell, 1929
Family Pontellidae

27.1.1 Epilabidocera longipedata (Sato, 1913)

Family Acartiidae

28.1.1 Acartia cf. clausi Giesbrecht, 1889
28.1.2 A. danae Giesbrecht, 1889
28.1.3 A. longiremis (Lilljeborg, 1853)
28.1.4 A. californiensis Trinast, 1976

Family Tortanidae

29.1.1 Tortanus discaudatus (Thompson and Scott, 1897)
2.0 KG I: KEY TO THE ORDERS OF COPEPODA

Basic features shared by all free-swimming copepods:

Crustaceans with a more or less cylindrical body bearing ventrally a series of paired trunk appendages. Anteriorly, these appendages, if present, are differentiated into a series of morphologically distinct feeding appendages; posteriorly, the appendages take the form of swimming legs, most of which are similar, although the fifth or hindmost pair in the adult may be modified or missing. An abdomen is separated from the trunk by an articulation which may be easily seen or may be obscured, depending on the taxonomic order of the specimen. The abdomen usually does not bear appendages, but in some orders may bear one very reduced pair of swimming legs. Total length ranges from approximately 0.20 mm to 10.0 mm.

KG I A key to the orders of copepods

Characters:

I. 2-5 pairs of appendages between A1 and P1 (y or n)
II. A1 with fifteen or more segments (y or n)
III. A2 biramous (b), uniramous (u) or absent (a)
IV. Ur distinctly narrower than Pro (narrow:n), or approximately equal in width (equal:e) (see Fig. 3)

Character sequence:

3.0 KG 2: KEY TO THE HARPACTICOIDA

Harpacticoids are typically benthic but two of several planktonic species, *Microsetella rosea* and *M. norvegica*, occur in the local plankton and are described in this manual.

Characters:

1. Body fusiform, Hd narrowing to a broad point, P1 not visibly different than P2 - P4 without dissection (y or n)*

2. Long terminal seta of Ur only as long as TL (short:s) or 1.5xTL (long:l)

3. Two setae on inner lobe of fP5 subequal (eq), or one much longer (unequal:un)

4. TL of male greater than 0.55 mm (y or n)

Character sequence:

* if answer is no, consult Wells (1976)

** Male A1 modified as grasping organ: bulbous swelling about midlength
4.0 KG 3: KEY TO THE MONSTRILLOIDA

Only five members of this order have been reported from the British Columbia area, and all belong to the genus Monstrilla.

Characters:

1. Al less than one-half length of cephalosome (y or n)
2. Number of setae on each fP5
3. Ro present (p) or absent (a)
4. Pair of conspicuous spines on the distal margins of Th1 and Th2 (y or n)
5. Al with branched setae (b), articulated distal segment (a), or neither (n)

6.1 Characters used in the Breakdown of KG 5

Ur  Urosome relative length
   s: Shorter than 1/3 prosome length
   r: Regular - approximately 1/3 prosome length
   l: Longer than 1/3 prosome length

TL  Total length
   vs: Very small - less than 1.0 mm
   s: Small - 1.0 to 2.5 mm
   m: Medium - 2.5 to 4.0 mm
   l: Large - 4.0 to 6.0 mm
   vl: Very large - over 6.0 mm

Hd  Head Shape (Fig. 6)
   r: Head profile rounded, without projections in dorsal view
   t: Head outline triangular with or without lateral hooks in dorsal view
   c: Apex of head with acute process or true crest in dorsal view
   b: Apex of head blunt (square-shaped) in dorsal view; may also be constricted posteriorly to form 'shoulders'
   s: Apex of head in lateral view with acute, spine-like process
   p: Apex of head in dorsal view with blunt papilla projecting anteriorly
   f: Head profile with pair of lateral, forward-directed projections

Al  Length of Al
   l: Longer than total length by more than two antennal segments
   r: 'Regular', approximately equal to total length
   s: Short, usually reaching no farther than distal margin of gnsht or Ur2

Ro  Rostrum
   y: Rostrum present
   n: Rostrum absent
6.2  Keys to subgroups of Calanoida

### 6.3 Keys to Species of the Calanoida

**KG 1000**

**Characters:**

I. Segmentation of first two pairs of swimming legs (P1 exp-enp/P2 exp-enp)

II. Presence of a serrate edge on inner margin of fP5 bpl (y or n)

III. Number of Th segments

IV. A1 much longer than TL (long:l), or about equal to TL (regular:r)

V. Cephalosome elongate; conspicuous gap between mouth parts and swimming legs (y or n)

**Character sequence:**

* Right and left basipod of fP5 usually fused and indistinct from body; legs may appear to be composed of only one segment.
KG 1030 (Calanus)

Characters:

I. Range, Pro length of adult female (mm) 1
II. Range, Pro length of adult male (mm)
III. Range, Pro length of fifth copepodite stage (CV)
IV. Shape of head in lateral view (rounded: r or angular: a) 2
V. Female P5 enpl and rt mP5 enpl extend nearly to or beyond median distal corner of P5 expl (long: l), or never extend close to this corner (short: s)
VI. CV and CVI P5 bp2 each bearing an elongate, spiniform process on distal anterior margin (elongate: e), or process short and pointed or blunt (short: s)

</tbody>
</table>

Calanus marshallae (8.1.1)
C. pacificus s.l. (8.1.2)

1 Body measurements are generally expressed as total length but in this case, the size separation is more distinct if prosome lengths (distance from apex of Hd to distal end of prosome) are used. Length is only an absolute method for separating species when there is a clear separation in sizes (e.g. KG 1040). With C. marshallae and C. pacificus, there is a slight overlap between the size ranges.

2 Head profile shape is a very subjective characteristic which nevertheless becomes relatively obvious with experience.
KG 1040 (Neocalanus)

Characters:

I. TL of copepodite with 4 or 5 Ur segments greater than 6.5 mm (y or n)
II. TL of copepodite with 3 Ur segments greater than 4.5 mm (y or n)

Character sequence:

* The lft mP5 lacks a bulbous swelling at the proximal portion of the bp2.

**Note:** Differences between species in this genus are often small and difficult to see. The genus is in need of revision.
KG 1220 (Clausocalanus)

Characters:

I. Female 3P5 longer than 2.0 x 1P5 (y or n)

II. In lateral view of female, gns gt dorsal lobe arising from anterior edge of ventral lobe (dorsal:d), or, a portion of gns gt ventral lobe visible anterior to the dorsal lobe (ventral:v)

III. Male Ur2 longer than 1.35 x 2P5 (y or n)

Character sequence:

</tr>
</tbody>
</table>

Note: The identifying characteristics used in KG 1320 are taken from Frost and Fleminger (1968).

The males of *C. arcuicornis* and *C. parapergens* can only be separated by looking at placement of the seminal vesicle within the prosome. If in lateral view the seminal vesicle extends anterior of the P1 attachment point to the prosome then it is *C. arcuicornis*. If the above is false then it could be *C. parapergens* or *C. lividus*. This distinction is difficult and not recommended by the authors.
KG 1800

Character:

I. Body densely spinose (y or n)
II. Segmentation of P1 exp-enp/P2 exp-enp
III. A2 exp longer than twice length of enp (y or n)
IV. P4 bpl with two or more spines above inner marginal seta (y or n)
V. Th4 fused with Th5 (f) or separate (s)

7.0 SPECIES DESCRIPTIONS

7.1 HARPACTICOIDA

1.1 Microsetella Brady and Robertson, 1873

Morphology:

Body fusiform and slightly laterally compressed; Pro cylindrical, not much broader than Ur; Ro short, stout, curved; CR short; Al very short, six-segmented (1, 2).

FEMALE Ur four-segmented.

MALE Ur five-segmented, occasionally six; Al slightly geniculate.

Segmentation of Ur may be indistinct; separation of sexes will require dissection and examination of P5.

References:

1) Davis, 1949b
2) Wilson, 1932
Microsetella norvegica (Boeck, 1864)

Synonymy:

Setella norvegica: Boeck (1864)
Microsetella atlanticum: Brady and Robertson (1873)
Ectinosoma atlanticum: Brady (1883)
Microsetella atlantica: Giesbrecht (1892)

Morphology:

Pro elongate, fusiform, tapering at either end; separation between Pro and Ur indistinct; each CR with one elongate seta about equal in length to TL, one shorter seta about equal in length to the Ur, and two very small setae (I).

FEMALE TL 0.35-0.57 mm; P5 with three lobes, the innermost of which bears two setae, one of which is about twice the length of the other; Ur four-segmented (I).

MALE TL 0.33-0.51 mm; Al geniculate, Ur five-segmented (I).

Distribution and Occurrence:

Reported from all oceans, from the Antarctic to the Arctic, including the Red, Mediterranean, Adriatic, Baltic and North Seas (I). Locally, reported from the vicinity of the Strait of Juan de Fuca (I) and the Queen Charlotte Islands (2).

Life History:

Juveniles undescribed; key valid for adults only.

Comments:

Other harpacticoids may be found in the plankton, particularly benthic forms which may occasionally rise into the water column as a swarm. Here, we describe one species, Microsetella norvegica, which is rare but planktonic, and occasionally occurs in the plankton of the study area. For positive identification of this or any other species of harpacticoid, refer to Wells (3).

References:

1) Davis, 1949b
2) Cameron, 1957
3) Wells, 1976
Microsetella norvegica

from Shen and Bai, 1956; Owre and Foyo, 1987; Tschislenko, 1987
1.1.2 Microsetella rosea (Dana, 1852)

Morphology:

Pro elongate, fusiform, tapering at either end; separation between Pro and Ur indistinct; each CR with one elongate seta about 1.7 x TL and one shorter, plumose seta (1, 2).

**FEMALE** TL 0.57-0.90 mm; CR each bear a short terminal seta in addition to the normal armature of two setae; P5 with three lobes, outer lobe bearing a single short spine, middle lobe with two elongate, subequal setae and one shorter seta, and inner lobe with two elongate, subequal setae (1).

**MALE** TL 0.6-0.7 mm; gnsgt divided, spermatophores conspicuous and showing through the body of ripe males; A1 six-segmented; P5 with three lobes, outer lobe bearing a single heavy spine, middle lobe with two coarsely setose setae, one about 1/2 the length of the other, and inner lobe with three short subequal spines (2).

Distribution and Occurrence:

Reported from the Malay Archipelago, Indian Ocean, Red, Mediterranean and Adriatic Seas, Atlantic Ocean, Indo-Pacific and North Pacific Ocean (1). Locally, reported from the Vancouver Island region and the Strait of Georgia (1, 3).

Life History:

Juveniles undescribed; key valid for adults only.

Comments:

Other harpacticoids may be found in the plankton, particularly benthic forms which may occasionally rise into the water column as a swarm. Microsetella rosea is rare but planktonic, and occasionally occurs in plankton samples within the study area. For positive identification of this or any other species of harpacticoid refer to Wells (4).

References:

2) Johnson, 1942
3) Fulton, 1972
4) Wells, 1976
Microsetella rosea
from Johnson, 1942; Lang, 1948
7.2 MONSTRILLOIDA

2.1 Monstrilla Dana, 1848

Morphology:

Pro slender, elongate; ansgt reduced, P1-P4 bp massive, enp and exp comparatively short. Characterized by an elongate cephalosome and the absence of any feeding appendages (1).

FEMALE Gnsqt bearing ventrally two spiniform processes (1).

MALE Gnsqt bearing ventrally a stout terminally bilobed process; Al geniculate between 4 Al and 5Al (1).

References:

1) Sars, 1921
2.1.1 **Monstrilla canadensis** McMurrich, 1917

**Morphology:**

**FEMALE** Undescribed.

**MALE** TL 1.5 mm; cephalosome widening posteriorly in dorsal view; Ur four-segmented, gnsgt prolonged ventrally into a strong, cylindrical projection broadened distally into two lobe-like processes; Al five-segmented, geniculation prominent; 5Al narrow at base but broadening distally into a hood-like process marked on the outer surface by a series of curved lines of minute spines (1).

**Distribution and Occurrence:**

Reported from the northwestern Atlantic Ocean from the type locality (Passamaquoddy Bay) (1), from Ungava Bay (2), from the North Pacific Ocean near Kodiak Island (3), and locally from Departure Bay (4).

**Life History:**

Only the adult and NI appear in the plankton; other juvenile stages are endoparasitic in molluscs and polychaetes and their ecology is poorly understood.

**Comments:**

*M. canadensis*, for which only the male is known, may be the male of *M. helgolandica* (2). The taxonomy of the family is in need of further study.

**References:**

1) McMurrich, 1917  
2) Fontaine, 1955  
3) Threlkeld, 1977  
4) Fulton, pers. comm.
Monstrilla canadensis
from McMurrich, 1917
2.1.2 Monstrilla helgolandica Claus, 1863

Synonomy:

M. serricornis: Sars (1921), Rose (1933)

Morphology:

Pro robust, broadening posteriorly; two eyes visible immediately dorsal to the A1 origin; A1 less than ½ length of cephalosome, A1 setae all single, unbranched (1).

FEMALE TL 1.4-2.3 mm; Ur four-segmented; gns gt long, with two ventral spiniform processes extending past CR; P5 slender, strongly divergent, each with two setae (1).

MALE TL 1.1 mm; Ur five-segmented; gns gt with ventral bilobed processes fringed with spines; P5 absent, A1 five-segmented, terminal segment with three rows of minute subapical spines (2).

Distribution and Occurrence:

Reported from the eastern North Atlantic Ocean and Mediterranean Sea, Ungava Bay, the Malay Archipelago, and the Indian Ocean (1, 2). Locally, reported from the Strait of Georgia (1).

Life History:

Only the adult and NI appear in the plankton, other juvenile stages are endoparasitic in mollusks and polychaetes and their ecology is poorly understood. In the northeastern Atlantic, juveniles are parasitic on the gastropod Odostomia rissoides. The host for the parasite stages of M. helgolandica in the northeastern Pacific is unknown.

Comments:

Gallien's (2) description of the female differs from Park's (1) in the segmentation of the A1. Park's specimen has only two distinct segments and Gallien's has four distinct segments. M. canadensis is often speculated to be the male of M. helgolandica (3, 4) and further investigation is needed to clarify this point.

Monstrilla helgolandica

from Gallien, 1934; Park, 1967
2.1.3 *Monstrilla longiremis* Giesbrecht, 1892

**Morphology:**

Pro elongate, cephalosome over ½ of TL, rectangular; A1 as long as cephalosome; A1 terminal setae branching (1).

**FEMALE** TL 3.7 mm; gnsgt with two ventral spiniform processes extending past CR; P5 each with four setae (1).

**MALE** TL 2.0 mm; gnsgt with two short ventral projections each terminating in a short spine. P5 each with one seta (1, 2).

**Distribution and Occurrence:**

Reported from the eastern North Pacific Ocean and Mediterranean Sea (1). Locally, reported from Alice Arm, B.C. (3).

**Life History:**

Only the adult and N1 appear in the plankton; other juvenile stages are endoparasitic in mollusks and polychaetes and their ecology is poorly understood.

3) Fulton, pers. comm.
2.1.3

Monstrilla longiremis

from Rose, 1933
2.1.4  *Monstrilla spinosa* Park, 1967

**Morphology:**

Cephalosome at least $\frac{1}{2}$ TL; Ro prominent; Thl, 2 each with two conspicuous spines arising from distal dorsal margin; the four subterminal setae of the Al are dichotomously branched (I).

**FEMALE** TL 2.87 mm; gnsgt bearing two ventral spiniform processes which extend beyond the CR. Al longer than cephalosome (I).

**MALE** TL 1.50 mm; gnsgt bears ventrally a prominent genital protuberance which carries distally a pair of spiniform processes. Al just shorter than cephalosome (I).

**Distribution and Occurrence:**

Reported only from the type locality, the Strait of Georgia (I).

**Life History:**

Only the adult and NI appear in the plankton; other juvenile stages are endoparasitic in mollusks and polychaetes and their ecology is poorly understood.

**References:**

1)  Park, 1967a
2.1.4

Monstrilla spinosa

from Park, 1967
2.1.5 Monstrilla wandelii Stephensen, 1913

Morphology:

Cephalosome exceeds ½ TL; Pro narrowed posteriorly; A1 shorter than cephalosome, with no branched setae (1).

FEMALE TL 1.98-2.46 mm; gnsgt with two ventral spiniform processes which extend almost to the end of the CR (1).

MALE TL 1.63 mm; gnsgt with a prominent, unbranched ventral protuberance (1).

Distribution and Occurrence:

Reported from the northwestern Atlantic Ocean near West Greenland (type locality) (1), and from the North Pacific near Kodiak Island (2). Locally, reported from the Strait of Georgia (1).

Life History:

Only the adult and N1 appear in the plankton; other juvenile stages are endoparasitic in mollusks and polychaetes and their ecology is poorly understood.

7.3 CYCLOPOIDA

3.1 Ascomyzon Thorell, 1859

Synonymy:

Asterocheres Boeck
Cyclopicera Brady (part)
Artotrogus Brady (part)

Morphology:

Pro almost as broad as long, dorsoventrally compressed (1).

FEMALE gnsbt broad, with lateral fringe of hairs (1).

MALE gnsbt enlarged, broader than that of female, and armed at each distal corner with a triangular lobe carrying a short spine (1).

References:

1) Sars, 1913
3.1.1 Ascomyzon rubrum Campbell, 1929

Morphology:

A1 short, nineteen-segmented; A2 robust with a strong apical spine; Pro almost as wide as long; Ur short (1).

FEMALE TL 0.95-1.1 mm; Ur three-segmented (1).

MALE Undescribed.

Distribution and Occurrence:

Known only from the northeastern Pacific Ocean. Originally described from Departure Bay, Vancouver Island. Also reported from the Strait of Georgia (2).

Life History:

Juveniles undescribed; however, at least the CV may be separable based on the wide Pro and short Ur.

References:

1) Campbell, 1929b
2) Legare, 1957
Ascomyzon rubrum

from Campbell, 1929
4.1  **Corycaeus** Dana, 1849

**Morphology:**

Pro cylindrical; PLC acute; Hd with two large, cuticular lenses, Ur one- or two-segmented; CR elongate; A1 short, six-segmented; P5 reduced to small setae (I).

**FEMALE**  Mxp curved terminal spine less than half the length of 2A2 (I).

**MALE**  Mxp curved terminal spine equal in length to 2A2(I).

**References:**

1)  Davis, 1949b
4.1.1  **Corycaeus anglicus** Lubbock, 1857

**Synonymy:**

*Corycaeus affinis*: McMurrich (1916); Campbell (1929b); Davis (1949); Cameron (1957); Legare (1957); Fulton (1968; 1972)

*C. japonicus*: Mori (1937)

**Morphology:**

PLC acute, extend caudally; Ur with three segments; gnsqt with median ventral hook near proximal margin; P4 enp reduced, with one or two segments and two apical setae (1).

**FEMALE** TL 1.1 mm; two distinct Th segments; cuticular lenses small (1).

**MALE** TL 0.8-0.9 mm; three distinct Th segments; cuticular lenses large (1).

Separable from the similar *C. catus* by the presence of two apical setae on the P4 enp (cf. 1 seta for *C. catus*).

**Distribution and Occurrence:**

Northeastern Atlantic Ocean (coast of Europe) (2) and Sea of Japan (3). Locally, reported from the coast of Vancouver Island (1), the Strait of Georgia (4, 5), and the vicinity of the Queen Charlotte Islands (6).

**Life History:**

Juveniles undescribed; however, the CV should be separable by the presence of two apical setae on the P4 enp.

**References:**

1) Davis, 1949b
2) Rose, 1933
3) Mori, 1937

from Rose, 1933

99
4.1.2  *Corycaeus catus* Dahl, 1894

**Synonymy:**

*Corycaeus obtusus*: Giesbrecht (1892:part); Herdman et al. (1898)

**Morphology:**

PLC acute, extended caudally; Ur with three segments; P4 enp reduced, one-segmented, but bearing a single, long seta (I).

**FEMALE**  TL 1.2 mm; Hd rounded; gnsgt elongate, tapering posteriorly (I).

**MALE**  TL 0.9 mm; Hd appears truncated anteriorly in dorsal view; gnsgt large, armed proximally with a hook-like projection on ventral side (I).

Separable from the similar *C. anglicus* by the presence of one apical seta on the P4 enp (cf. 2 setae for *C. anglicus*).

**Distribution and Occurrence:**

Reported from the Pacific and Atlantic Oceans (I). Locally, reported as common near Port Townsend, Washington (2).

**Life History:**

Juveniles undescribed; however, the CV should be separable by the single seta on the P4 enp.

**References:**

1)  Mori, 1937
2)  Herdman et al., 1898
4.1.2

Corycaeus catus

from Mori, 1937
5.1  **Macrocheiron** Brady, 1872

**Morphology:**

Pro elongate; Ur elongate; Ro with a slender, needle-like process; A1 short. P1-P3 with three-segmented rami, P4 segmentation 3-1 or 3-2; P5 one-segmented with two terminal setae (1).

FEMALE  Ur five-segmented; A1 seven-segmented (1).

MALE    Ur six-segmented (1).

**References:**

1)  Humes and Stock, 1973
5.1.1 **Macrocheiron sargassi** Sars, 1916

**Morphology:**

Pro, Ur elongate; A1 short; gnsgt large; P4 segmentation: 3-1 or 3-2 (1, 2).

**FEMALE** TL 0.8-1.2 mm; Ur five-segmented (1, 2).

**MALE** TL 0.6-1.0 mm; Ur six-segmented (1, 2).

**Distribution and Occurrence:**

Reported from the northwestern Atlantic Ocean (Sargasso Sea) and from the Caribbean Sea near the island of Curacao (2). Locally, reported from Departure Bay (1). Typically associated with ascidians, although other members of the genus are free swimming (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

The only species of the genus Macrocheiron reported from the study area. The Departure Bay record (1) is poorly documented and unverified (2).

**References:**

1) Campbell, 1930
2) Humes and Stock, 1973
Macrocheiron sargassi

from Sars, 1916; Humes and Stock, 1973
6.1  **Oithona** Baird, 1843

**Morphology:**

Pro slender; Ur elongate; A1 elongate with ten to fifteen segments; P1-P4 segmentation all 3-3; P5 rudimentary (1).

**FEMALE**  Ur five-segmented (1).

**MALE**  Ur six-segmented; both A1 geniculate (1).

**References:**

1)  Davis, 1949b
6.1.1  *Oithona similis* Claus, 1863

**Synonymy:**

*Oithona helgolandica*: Sars (1916)

*O. challenger*: Brady (1883)

**Morphology:**

Pro elongate; Pro:Ur ratio approximately 1.3; Al just longer than Pro; Ro present in female only, acute, ventrally directed (1).

**FEMALE**  TL 0.7-1.0 mm (1).

**MALE**  TL 0.5-0.7 mm (1).

**Distribution and Occurrence:**

Worldwide in all oceans (1). Locally, reported as common in deep waters in and adjacent to the Strait of Georgia (2, 3, 4), and from the vicinity of the Queen Charlotte Islands (5).

**Life History:**

Juveniles undescribed. The relatively short Al (barely exceeds Pro) may allow juveniles of this species to be separated from other local members of the genus, in which the Al reaches the ansa.

**References:**

1)  Davis, 1949b
2)  Campbell, 1929b
3)  Legare, 1957
4)  Fulton, 1972
5)  Cameron, 1957
Oithona similis

from Rose, 1933

109
6.1.2  *Oithona spinostris* Claus, 1863

**Synonymy:**

*Oithona plumifera*: Davis (1949b:part)

**Morphology:**

Pro elongate; Ro in female only, strong, spiniform and visible in dorsal view; P5 present as small conical segment with two apical setae (1).

**FEMALE** TL 1.2-1.4 mm (1); A1 reaching to ansgt.

**MALE** TL 0.7-0.8 mm (1); A1 articulated, shorter than Pro.

Separable from *O. plumifera* only by the absence of a small papilla on the ventral aspect of the female Th5.

**Distribution and Occurrence:**

Worldwide (2). Locally, abundant in the Strait of Georgia (3) and also reported from the vicinity of the Queen Charlotte Islands (4).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

*Oithona plumifera* and *O. spinostris* may be synonymous (2) and need to be carefully studied if they are to be adequately separated or synonymized.

**References:**

1) Campbell, 1929b  
2) Davis, 1949b  
3) Fulton, 1972

110
Oithona spinostris

from Mori, 1937
7.1 \textit{Oncaea} Philippi, 1943

\textbf{Morphology:}

Pro elongate, Ur variable; P1-P4 with long, slender enp, bp2 lacking seta on inner distal margin (I).

\textbf{FEMALE} Ur six-segmented (Ur3 elongate); A1 six-segmented (I).

\textbf{MALE} Ur six-segmented; gnsgt voluminous with produced lateral angles (I).

\textbf{References:}

1) Heron, 1977
7.1.1  Oncaea borealis  Sars, 1918

**Morphology:**

Pro elongate; gns gt approximately ½ Ur; P3 exp and enp elongate and thin (1, 2).

**FEMALE**  TL 0.7 mm; Th 2 with dorsal projection visible in lateral view; P5 short, oval (1, 2).

**MALE**  TL 0.4 mm; Th2 without dorsal projection; distal corners of gns gt with pronounced lateral projections (1, 2).

**Distribution and Occurrence:**

Reported from the North Atlantic Ocean and adjacent temperate and Arctic waters (1). Locally, reported from the Strait of Juan de Fuca (3).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

This genus contains many species that are quite similar, especially the males. A revision of the genus is required before specific identifications can be carried out routinely and easily.

**References:**

1)  Sars, 1918
2)  Rose, 1933

Oncaea conifera

from Mori, 1937; Owre and Foyo, 1967
7.1.3  *Oncaea englishi* Heron, 1977

**Morphology:**

Pro elongate, Pro:Ur ratio 1.7-1.8; gnsogt over 1/2 of Ur; A1 short; Th2 without dorsal projection, Th3 with acute, curved posteroventral corners; PLC acute, slightly curved; ansgt and CR with spinulose dorsal patches; all P1-P4 rami three-segmented, bpI without spine on distal inner margin; CR just shorter than width of ansgt (I).

**FEMALE**  TL 0.95-1.15 mm; Ur five-segmented (1).

**MALE**  TL 0.85-1.00 mm; Ur six-segmented (1).

**Distribution and Occurrence:**

Reported from the type locality, the southwest Pacific/Antarctic area (1), and locally, from the Strait of Juan de Fuca (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

This genus contains many species that are quite similar, especially the males. A revision of the genus is required before specific identifications can be carried out routinely and easily.

**References:**

1) Heron, 1977
2) Chester et al., 1980
Oncaea englischii
from Heron, 1977
7.1.4 Oncaea ivlevi Shmeleva, 1966

**Morphology:**

Pro:Ur ratio approximately 2.0; Th2 lacking dorsal projection; CR approximately as long as width of ansgt. P1-P4 rami with thin, elongate terminal segments; P3,4 exp3 armed with two lateral spines; P1,2 exp3 armed with three lateral spines (I).

**FEMALE** TL 0.32–0.33 mm; gns gt approximately ½ length Ur (I).

**MALE** TL 0.30–0.31 mm; gns gt large, with acute distal corners. Ur2-Ur4 reduced (I).

**Distribution and Occurrence:**

Reported from the Adriatic Sea and tropical regions of the Atlantic Ocean between 4°59'N and 9°51'S over a wide range of depths, but more concentrated above 500m (I). Locally, reported from the Strait of Juan de Fuca (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

This genus contains many species that are quite similar, especially the males. A revision of the genus is required before specific identifications can be carried out routinely and easily.

**References:**

1) Shmeleva, 1966, 1969
2) Chester et al., 1980
Oncaea ivlevi
from Shmeleva, 1966
7.1.5  *Oncaea prolata*  Heron, 1977

**Synonymy:**

*Oncaea notopus*:  Giesbrecht, 1902

**Morphology:**

Pro elongate, Pro:Ur ratio approximately 1.9; A1 short; Th2 lacking dorsal projection; CR just shorter than width of ansgt; gnsgt just less than ½ Ur, bearing transverse rows of spinules around and below a ledge protruding anteroventrally; P1-P4 rami three-segmented, bpl without seta on distal inner margin; P2 exp3 bearing three lateral spines (1).

**FEMALE** TL 0.67-0.72 mm (1).

**MALE** Undescribed.

**Distribution and Occurrence:**

Reported from the type area, the southwest Pacific-Antarctic (1), and locally, from the Strait of Juan de Fuca (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

This genus contains many species that are quite similar, especially the males. A revision of the genus is required before specific identifications can be carried out routinely and easily.

Oncaea prolata
from Heron, 1977
7.2  **Lubbockia** Claus, 1863

**Morphology:**

Pro elongate; Ur slender; A1 short, seven-segmented; P1-P4 segmentation all 3-3; P1-P4 bp2 with seta at inner margin; mxp large and easily seen; P5 one-segmented with two spines (1).

**References:**

1) Heron and Damkaer, 1978
7.2.1  **Lubbockia minuta** Wolfenden, 1905

**Synonymy:**

**Lubbockia glacialis:** Heron and Damkaer (1969)

**Morphology:**

Ur elongate; Ro broadly rounded; P1-P4 bpl with short seta on inner margin; P1,2 exp3 each with three spines on outer edge (1).

**FEMALE** TL 1.29-1.50 mm; Ur five-segmented and as long as Pro (1).

**MALE** TL 2.00-2.31 mm; Ur six-segmented and 1.3 x Pro (1).

**Distribution and Occurrence:**

Reported from the northwestern and tropical Atlantic Ocean and the northeastern Pacific Ocean (1). Locally, reported from the Strait of Juan de Fuca (2).

**Life History:**

The CV ranges from 1.03 - 1.10 mm, and has a five-segmented Ur (cf. five segments in the fCVI and six in the mCVI); the CIV ranges from 0.89-0.93 mm, and has a four-segmented Ur (1). Younger stages are undescribed.

Lubbockia minuta
from Heron and Damkaer, 1978
7.2.2  Lubbockia wilsonae Heron and Damkaer, 1969

Synonymy:

Lubbockia aculeata: Vervoort (1957)
NOT L. aculeata: Giesbrecht (1891)

Morphology:

Pro elongate, Pro:Ur ratio approximately 0.7; CR elongate; P5 elongate, rectangular; P1, 2 exp3 each with only two spines on outer margin (1).

FEMALE  TL 2.60-2.98; Ro broadly rounded; Ur six-segmented (1).

MALE  TL 1.96-2.08; Ro less rounded than in female; Ur five-segmented (1).

Distribution and Occurrence:

Northeast Pacific and Antarctic waters (1). Locally, rare but reported from samples collected by the Ocean Ecology Laboratory in Knight, Rivers and Loughborough Inlets.

Life History:

Female CV 1.98 mm, mCV 1.75 mm; Ur five-segmented; P5 well-developed. CIV 1.48 mm; Ur four-segmented; P5 small, with two spines. CIII 0.97-1.06 mm; Ur three-segmented; P5 present as spine only (1).

References:

**Lubbockia wilsonae**

from Heron and Damkaer, 1969, 1978
7.3  **Pseudolubbockia** Sars, 1909

**Morphology:**

Pro elongate; Ur slender; Al short, five to seven segments; Pl-P4 segmentation all 3-3; Pl-P4 bpl with seta at inner margin; Mxp large and easily seen; P5 one-segmented with four spines (1, 2).

**References:**

1) Heron and Damkaer, 1978
2) Heron and Damkaer, 1969
7.3.1  

Pseudolubbockia dilatata  Sars, 1909

Morphology:

Most of the body surface, appendages, and mouth parts densely covered with minute papillae or minute setules (1).

**FEMALE**  
TL 2.31-3.02 mm; PLC flared laterally, appears square in dorsal view; Ur six segments; CR twice as long as wide; A1 six-segmented (1).

**MALE**  
TL 1.35-1.40 mm; PLC flared laterally, appears rounded in dorsal view; UR five-segmented; CR almost as wide as long; A1 five-segmented with two faint sutures on terminal segment (1).

Within the study area, only one other species has a densely spinulose body surface. This is a calanoid, Centraugaptilus porcellus.

Distribution and Occurrence:

Common in Puget Sound (2) but not reported from other regions within the study area.

Life History:

Juveniles undescribed; late copepodite stages probably similar to those of Lubbockia wilsonae (3).

References:

1) Heron and Damkaer, 1969  
2) Chester et al., 1980  
3) Heron and Damkaer, 1978
Pseudolubbockia dilatata

from Heron and Damkaer, 1969
7.4 CALANOIDA

8.1 Calanus Leach, 1816

Synonymy:

Nannocalanus Sars, 1925

Morphology:

The least morphologically specialized genus of the order. Body fusiform; mouthparts the same in both sexes; max2 with five or six setae on first inner lobe. Swimming legs unmodified; P5 bpl with denticulate inner margin; P5 in both sexes only slightly modified (1).

FEMALE P5 enp with seven or eight setae (1).

MALE P5 enp usually with eight setae, rarely four or seven (1).

</tbody>
</table>

Comments: Genus redefined by Bradford and Jillett (1).

References:

1) Bradford and Jillett, 1974
8.1.1 *Calanus marshallae* Frost, 1974

**Synonymy:**

*C. glacialis*: Woodhouse (1971); Fulton (1972)

**Morphology:**

Pro:Ur ratio approximately 4; Pro fusiform; Hd smoothly rounded; PLC rounded; CR approximately as long as width of ansgt; P5 bp1 inner margin denticulate; P5 bp2 with short process on distal anterior margin (1, 2).

**FEMALE** TL 3.2-4.2 mm; P5 enpl does not reach median distal corner of P5 expl (1).

**MALE** TL 3.5-4.0 mm; P5 exp slightly reduced, exp3 tapering distally (1).

**Distribution and Occurrence:**

Reported from the eastern North Pacific Ocean, waters adjacent to the Aleutian Islands and the eastern Bering Sea (2). South to about 40°26' N along the eastern edge of the Pacific (1). Found locally throughout the study area; occasionally very abundant, especially in spring (April, May). Second only to *Neocalanus plumchrus* in terms of biomass contribution to the zooplankton.

**Life History:**

The juvenile stages have not been described; however, their sizes are known (3). The CV is similar to the adult and can be identified directly using the key, but may be confused with the smaller *C. pacificus* or the larger *Neocalanus plumchrus*.

</tbody>
</table>

**Comments:**

Because of its high population biomass, *C. marshallae* may be locally important in the diet of planktivorous fishes (e.g. young salmonids; herring). The species is a major component of the food web in most locations along the coast.

136

Calanus marshallae
from Woodhouse, 1971

137
8.1.2  *Calanus pacificus* s.l. Brodsky, 1948

**Synonymy:**

*Calanus finmarchicus*: Esterly (1924)  
*Calanus sp.*: Shan (1962)

**Morphology:**

Pro:Ur ratio approximately 4; Pro fusiform; Hd rounded, but somewhat angular in lateral view; P5 bp2 with an elongate, spiniform process on distal anterior margin; P4 bpl inner margin denticulate (1).

**FEMALE**  TL 2.6-3.0 mm; P5 enpl extends nearly to, or beyond median distal corner of P5 expl (1).

**MALE**  TL 2.5-2.8 mm; P5 exp slightly reduced, exp3 tapering distally (1).

**Distribution and Occurrence:**

Reported from across the North Pacific, but its distribution is not continuous and the species apparently consists of three geographically discrete sub-species (2). The easternmost of these sub-species, *Calanus pacificus californicus*, extends from the northern end of the Baja Peninsula to Dixon Entrance (1, 3).

**Life History:**

The juvenile stages have not been fully described; however, their sizes are known (4). The CV is similar to the adult and can be identified directly from the key, but may be confused with *C. marshallae*.

**Comments:**

Genus redefined by Bradford and Jillett (I).

**References:**

1) Bradford and Jillett, 1974
8.2.1 *Neocalanus cristatus* (Kroyer, 1848)

**Synonymy:**

Calanus cristatus: Giesbrecht (1892); Campbell (1929b); Mori (1937);
Brodsky (1938, 1950); Tanaka (1956a); Davis (1949b)

**Morphology:**

Pro elongate, fusiform; Hd cristate; PLC rounded; A1 exceeds TL; CR short; P5 bpl with smooth inner margin (1).

**FEMALE** TL 8.5-10.4 mm; gnsgt strongly swollen, slightly wider than long; Ur short (1).

**MALE** TL 9.0-9.8 mm; Hd crest reduced in comparison with female; Ur2 longest Ur segment, almost as long as wide; P5 exp3 reduced (1).

**Distribution and Occurrence:**

Reported from the North Pacific Ocean, Bering Sea, Seas of Japan and Okhotsk (1). Locally, rare but reported from the Strait of Georgia (2), Queen Charlotte Sound, Hecate Strait, Dixon Entrance and adjacent waters (3, 4).

**Life History:**

The juveniles are not fully described; however, the CIV and CV are similar to the adult and conform to the characters used in the key. Length ranges have been reported for all copepodite stages (2).

**Comments:**

In terms of biomass, *N. cristatus* is one of the dominant zooplankters in the North Pacific and as such is an important component of the food web. Locally, it is too rare to have a large impact on energy transfer, but it may be important as an indicator of intrusions of oceanic water into inshore areas (3, 4).

1) Brodsky, 1950  
2) Fulton, 1972  
3) Gardner, 1982a  
4) Gardner, 1982b
Neocalanus cristatus from Mori, 1937; Brodsky, 1950
8.2.2  *Neocalanus plumchrus* (Marukawa, 1921)

**Synonymy:**

*Calanus plumchrus*: Marukawa (1921); Mori (1937); Tanaka (1956b)
*C. tonsus*: Campbell (1929b, 1930, 1934a); Davis (1949b); Tanaka (1954)

**Morphology:**

Pro fusiform; Pro:Ur ratio about 5; Hd and PLC rounded; A1 approximately equal TL; inner margin of P5 bpl smooth (1, 2).

**FEMALE**  TL 4.5-5.1 mm (3).

**MALE**  TL 4.3-4.8 mm; P5 slightly reduced, exp3 tapering distally (1, 3).

**Distribution and Occurrence:**

Widely distributed in the North Pacific. Found throughout the range covered in the key, but adults generally restricted to depths below 250 m.

**Life History:**

All stages are fully described (1), and their life history studied (4). The dominant stage during most of the year is the CV, which overwinters in deep water. In January and February, the CV molts to the adult. Adult females each produce several hundred eggs fertilized and released at depth. Young naupliar stages ascend to near surface where they can completely dominate the plankton in early spring. Growth proceeds to the CV, which descends to depth in August or September and begins to overwinter. The male and female are short-lived and usually disappear by April. Overwintering CV's and adults feed minimally or not at all. The characters used in this key will also allow identification of the CV and CIV, but may be confused with juveniles of *C. marshallae*.

**Comments:**

Genus erected by Bradford and Jillett (1).

**References:**

1) Bradford and Jillett, 1974
8.3.1 **Mesocalanus tenuicornis** (Dana, 1849)

**Synonymy:**

*Calanus tenuicornis*: Dana (1853); Giesbrecht (1892); Esterly (1905); Vervoort (1946); Farran and Vervoort (1951a); Brodsky (1950); Bowman (1955)

**Morphology:**

Pro:Ur ratio approximately 3.0; five thoracic segments; P1 expl with spine on outer distal corner; P5 bpl with smooth inner margin; CR relatively long (1).

**FEMALE** TL 1.8-2.4 mm; A1 exceed TL by seven or more segments; gnsgt moderately swollen, protruding ventrally (1).

**MALE** TL 1.5-1.9 mm; spines on dorsal surface of Th3 - Th4; A1 slightly longer than TL; mouthparts reduced; P5 slightly asymmetrical; lft P5 exp3 reduced, narrowing distally (1, 2).

Separable from most other local taxa by size, the presence of a rostrum, and the elongate A1; however, the A1 may be broken off in preserved samples.

**Distribution and Occurrence:**

Widespread in temperate and subtropical zones. Reported from the Atlantic, Pacific and Indian Oceans, the Mediterranean Sea, and adjacent waters but nowhere abundant (1, 2). Locally, rare and not usually found in protected waters. More abundant on the continental shelf (e.g. Queen Charlotte Sound, Hecate Strait, Dixon Entrance) and adjacent waterways (4).

**Life History:**

The juveniles are undescribed; however, the characters used in the key should allow identification of the CV.

**Comments:**

Not economically important, but may be an important indicator of an intrusion of equatorial water (4).

**References:**

1) Brodsky, 1950
2) Farran and Vervoort, 1951a (Fiches, Sheet 32)
3) Chester et al., 1980
4) Gardner, 1982a
Mesocalanus tenuicornis
from Brodsky, 1950
9.1 **Eucalanus Dana, 1852**

**Morphology:**

Hd elongate and narrowed apically; body highly transparent, with elongate cephalosome and large gap between mouthparts and swimming legs. Ro with long filaments; Al longer than total length. P1 exp-enp segmentation: 3-2 or 2-2, CR fused with ansgt.

**FEMALE** P5 absent (1, 2).

**MALE** P5 uniramous, mouthparts reduced (1, 2).

The elongate cephalosome and gap between mouthparts and swimming legs are distinctive and readily seen in all copepodite stages.

**References:**

1) Brodsky, 1950
2) Farran and Vervoort, 1951c (Fiches, Sheet 34)
9.1.1 Eucalanus bungii Giesbrecht, 1892

Synonymy:

Eucalanus elongatus var. bungii: Giesbrecht (1892); Johnson (1937)
E. giesbrechti: Mori (1937)
E. bungii bungii: Johnson (1938); Brodsky (1950); Tanaka (1956a); Fulton (1972)
E. elongatus: Campbell (1929b)

Morphology:

Pro-elongate; conspicuous gap between mxp and Pl visible in all copepodite stages; Hd produced anteriorly; bluntly triangular apex; PLC rounded; Al exceeding CR by about four segments; Pl exp3 with two spines on outer margin; md bp2 with three setae; ansgt fused with CR (1).

FEMALE TL 6.0-8.0 mm; Ur four-segmented (including fused CR/ansgt) (1).

MALE TL 4.8-5.5 mm; Ur five-segmented (including fused CR/ansgt) (1).

Separable from other local Eucalanus by the presence of two spines on the outer margin of Pl exp3 and three setae on the md bp2. The latter character is the only point separating E. bungii from E. californicus, and may be difficult to verify in males due to the reduction of the mouthparts.

Distribution and Occurrence:

Boreal and sub-Arctic in the North Pacific, Bering Sea and adjacent waters (2). Locally, ubiquitous but more numerous in the Strait of Georgia and with occasional high densities at specific locations along the coast (3, 4).

Life History:

The juveniles are well described (5).

<table>

Comments:

Occasionally abundant, rarely dominant. The species of Eucalanus are all very similar in gross morphology. Historical records of E. bungii in the British Columbia coastal zone may include small numbers of other members of the genus (3, 5).

References:

1) Johnson, 1938
2) Brodsky, 1950
3) Krause and Lewis, 1979
4) Gardner, 1982a
5) Johnson, 1937

152
Eucalanus bungii
from Flemingier, 1975; Park, 1968; male original
9.1.2 *Eucalanus californicus* Johnson, 1938

**Synonymy:**

*Eucalanus bungii californicus:* Johnson (1938); Brodsky (1950); Tanaka (1956a)
*E. elongatus:* Esterly (1905)

**Morphology:**

Pro elongate; conspicuous gap between mxp and PI visible in all copepodite stages; Hd produced anteriorly, bluntly triangular apex; PLC rounded; PI exp3 with two outer edge spines; md bpl with only one seta; A1 exceed TL and one A1 may exceed the other in length (I).

**FEMALE** TL 5.9-7.0 mm; Ur four-segmented (including fused CR/ansgt) (I).

**MALE** TL 4.7-5.0 mm; Ur five-segmented (including fused CR/ansgt) (I).

Separable from other local *Eucalanus* by the presence of two outer edge spines on the PI exp3 and of only one seta on the md bpl. The latter character is the only character separating males of *E. californicus* from *E. bungii*, and may be difficult to verify due to the reduction in the mouthparts.

**Distribution and Occurrence:**

Reported from the temperate North Pacific; particularly from the California coast (2). Locally rare, but reported from the vicinity of Malcolm Island in Queen Charlotte Strait (3).

**Life History:**

Juveniles have not been described, but should be similar in general form to those of *E. bungii* (4).

**Comments:**

Because *E. bungii* and *E. californicus* are very difficult to differentiate in the adult, many records of *E. bungii* may involve both species. The distribution and abundance of both species in British Columbia waters should be re-examined. *E. californicus* may be an indicator of water originating to the south (e.g. off the coast of California).

**References:**

1) Johnson, 1938  
2) Brodsky, 1950  
3) Davis, 1949b  
4) Johnson, 1937
Eucalanus californicus

from Johnson, 1938; Fleminger, 1973
9.1.3  Eucalanus hyalinus  (Claus, 1866)

Morphology:

Hd slightly elongate; PLC pointed and slightly elongate; dorsal surface of thorax lightly spinulose; PI exp3 with single spine on outer margin; md bp2 with three lateral setae (1).

FEMALE  TL 4.5-5.8 mm (1).

MALE    TL 3.2-5.0 mm; lft P5 elongate, similar in length to P4 (1).

Due to the great similarity between local members of this genus, records of E. hyalinus from the British Columbia coast should be interpreted with caution. Nevertheless, it is possible to separate the species in most stages. E. hyalinus is unique in the possession of a single spine on PI exp3 (vs two spines in other local members of the genus), and can also be identified, in the adult female, by the pattern of integumental organs (2).

Distribution and Occurrence:

Reported from the North Atlantic, Indian Ocean and Mediterranean Sea (1). Locally, reported from the California coast (3, 4) and from near Port Townsend, Washington (5).

Life History:

The juveniles have not been described; however, E. bungii has been completely described (6), and E. hyalinus will follow basically the same pattern. The characters used in the key should identify the CV and possibly CIV.

Comments:

May not occur in the study area other than as a rare immigrant from California coastal waters.

References:

1) Brodsky, 1950
2) Fleminger, 1973
3) Esterly, 1905

6) Johnson, 1937
Eucalanus hyalinus

from Johnson, 1938; Fleminger, 1973
9.2 **Rhincalanus** Dana, 1852

**Morphology:**

Head elongate and narrowed apically; Ro prominent, with two basally spaced filaments. Al much longer than total length. Cephalosome elongate, but without space between mouthparts and swimming legs. P1 segmentation: 2-2; CR fused with ansgt (1, 2).

**FEMALE** Ur three-segmented; P5 reduced, uniramous (1).

**MALE** Ur four-segmented; lft P5 biramous, exp reduced, one-segmented, enp two-segmented, segments stout, fringed with hairs; rt P5 uniramous, two-segmented, distal segment armed with a long curved apical spine (1, 2).

The elongate cephalosome, triangular head and placement of mouthparts are distinctive.

**References:**

1) Brodsky, 1950
2) Farran and Vervoort, 1951c (Fiches, Sheet 34)
9.2.1  Rhincalanus nasutus  Giesbrecht, 1888

Morphology:

Pro elongate anteriorly, but without obvious gap between mxp and PI; Hd produced anteriorly to a smoothly rounded, triangular apex; Th1, 2, 3 each with acute backward-directed projections originating from lateral distal margin (1).

**FEMALE** TL 3.6-5.1 mm; Ur three-segmented, gnsgt with two dorsal spines; P5 uniramous, 2P5 with inner distal seta, 3P5 with one inner and two apical setae (1).

**MALE** TL 2.7-3.8 mm; lft P5 biramous, enp two-segmented, spinose; rt P5 uniramous, distal segment with large, curved apical spine (1).

Distribution and Occurrence:

Widespread in deep water. Reported from the Barents, Norwegian and Greenland Seas, and the Atlantic, Pacific and Indian Oceans (1). Locally, rare and restricted to open water stations. Recorded from the vicinity of the Queen Charlotte Islands (2) and Queen Charlotte Strait (3).

Life History:

Information on the NII to NVI has been summarized and the sizes recorded below (4). The NII may not occur as a free-living stage in the plankton, with the NII hatching directly from the egg.

<table>
<thead>
<tr>

Rhincalanus nasutus
from Sars, 1903; Mori, 1937; Brodsky, 1950
10.1  *Calocalanus* Dana, 1849

**Morphology:**

Small copepods between 0.36 and 1.30 mm in total length. P1 bpl without seta at inner distal corner (I).

**FEMALE**  Ur short and wide, with 2-4 segments; gnsgt globular (I).

**MALE**  Ur usually with five segments; ansgt twice as long as preceding segment (I).

**References:**

1) Bernard, 1958
10.1.1 Calocalanus styliremis Giesbrecht, 1888

**Morphology:**

Pro robust; Ro bifurcate; Ur short; A1 greatly exceeds TL; three thoracic segments (1).

**FEMALE** TL 0.50-0.95 mm; Ur three-segmented, but Ur2 reduced and may be difficult to see; gnsgt globular; P5 symmetrical, three-segmented, distal segment with a single elongate spine (1).

**MALE** TL 0.48-0.50 mm; Ur five-segmented; lft P5 five-segmented, rt P5 three-segmented (1).

**Distribution and Occurrence:**

Likely world-wide, except in polar seas, although nowhere abundant. Locally, reported from the Strait of Juan de Fuca (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

This and similar small species will be undersampled by most collecting techniques. The use of finer mesh nets may result in more extensive records for the study area.

Paracalanus parvus (Claus, 1863)

Morphology:

Pro stocky, widest in anterior third; Hd rounded; Ro with two short filaments; A1 reach distal segments of Ur; P2,3 enp with spinous outer surfaces, exp3 with serrate outer margin, exp apical spine smooth, not serrate (1).

FEMALE TL 0.7-1.2 mm; Ur four-segmented; P5 symmetrical, uniramous, reduced and often difficult to see; P5 two- or sometimes three-segmented (1).

MALE TL 0.8-1.4 mm; Ur five-segmented, max2 reduced, mxp atrophied; P5 asymmetrical, uniramous; Ift P5 five-segmented; rt P5 two-segmented, slightly longer than IP5 (1).

Distribution and Occurrence:

Cosmopolitan in all seas with the exception of polar regions (2). Locally, recorded from the Vancouver Island region (4). Reported also from the vicinity of the Queen Charlotte Islands (5). Not usually abundant, although historical records of abundance are difficult to confirm due to confusion with Pseudocalanus. The species is abundant in the Strait of Georgia (6) and also reported from the Strait of Juan de Fuca (7).

Life History:

The nauplii have been briefly described and their sizes recorded (8). Juvenile copepods have not been described, but the characters used in the key should allow identification of the CV.

**Comments:**

This genus contains a number of similar and poorly defined species and is in need of a complete revision (3).

**References:**

1) Brodsky, 1950
2) Farran and Vervoort, 1951e (Fiches, Sheet 37)
3) Corkett and McLaren, 1978
12.1.1 **Pseudocalanus cf. minutus** (Kroyer, 1845)

**Synonymy:**

- Clausia elongata: Boeck (1872)
- Lucullus acuspes: Giesbrecht (1882)
- Calanus minutus: Kroyer (1845)
- Pseudocalanus elongatus: McMurrich (1916); Campbell (1929b); Wailes (1929); Johnson (1932)

**Morphology:**

Pro: slender; Ur: thin, slightly elongate; Pro:Ur ratio approximately 2; Ro of two slender filaments; PI expl with outer distal spine, spine longer than exp2 (1).

**FEMALE** TL 0.7-2.0 mm; gnsgt almost as long as the two following segments combined, Al barely reach beyond Ur2; P5 absent (1).

**MALE** TL 1.1-1.4 mm; ansgt reduced; Al reach end Ur2; Ift P5 five-segmented, rt P5 four-segmented (1).

**Distribution and Occurrence:**

The genus *Pseudocalanus* is basically northern boreal, and extends across the Arctic. Southern limits of distribution are not well documented, but extend south to about 40°N latitude only along cool, coastal margins (1). Locally, extremely abundant throughout the area and often numerically dominant in the larger zooplankton (2, 3, 4).

**Life History:**

All juvenile and naupliar stages of *Pseudocalanus* have been described (1). Size ranges have been reported for all stages of *P. minutus* (2).

**Comments:**

Although abundant, cosmopolitan copepods, this genus is poorly known and a complete revision is required (1). Until then, the local form cannot be unambiguously referred to a given species or group of species. The authors follow the example of With (5), Frolander (6), and Fulton (2) in calling the local species *P. minutus*. The most complete set of illustrations are those done by Sars (7) of *P. elongatus* and have been used in Fig. 12.1.1.

12.2.1 *Microcalanus pygmaeus pusillus* Sars, 1903

**Synonymy:**

*Microcalanus pusillus*: Sars (1903); Campbell (1929b); Brodsky (1950); Legare (1957); Fulton (1968)

**Morphology:**

Ro of two filaments; PLC rounded or produced as short, round processes; A1 just less than TL; CR short; PI expl lacking outer spine, PI enp with four setae (1).

**FEMALE** TL 0.7-0.9 mm; P5 lacking; P2-P4 exp3 with serrate apical spines (1).

**MALE** TL 0.7-0.8 mm; P5 asymmetrical; rt P5 three-segmented; Ift P5 six-segmented, twice length of rt P5 (1).

**Distribution and Occurrence:**

Widespread in cold water. Reported from the North Atlantic and North Pacific Oceans and Antarctic region (1, 2). Locally, recorded as abundant in surface waters of the Strait of Georgia (3).

**Life History:**

The juvenile copepodites have not been described; however, the naupliar stages have been described briefly and sizes reported (3).

**Comments:**

Sars described two species of *Microcalanus*: *M. pusillus* (4) and *M. pygmaeus* (as *Pseudocalanus pygmaeus*; 5). The differences between these species are minor. *M. pygmaeus* has finely toothed apical spines on the P2-P4 exp, versus coarsely toothed apical spines for *M. pusillus*. Right mP5 of *M. pygmaeus* is approximately 0.5 x Ift mP5. In *M. pusillus*, rt mP5 is approximately 0.33 x Ift mP5. However, intermediate forms occur, and Farran and Vervoort (6) adopt the view that the two forms are sub-specific varieties of *M. pygmaeus*. We follow that viewpoint, but further taxonomic work should be done on the species.

Microcalanus pygmaeus pusillus
from Brodsky, 1950; Tanaka, 1956
12.3  *Clausocalanus* Giesbrecht, 1888

**Morphology:**

Small copepod with a TL less than 2.0 mm; Hd and PLC rounded; thorax three-segmented. A1 equal to or less than Pro length. CR with short medial setae originating from dorsal surface; lateral-most caudal seta reduced to a short spine; two apical and two subapical caudal setae. A2 exp 1½ x longer than enp. Exp-enp segmentation of P1 through P4: 3-1/3-2/3-3/3-3. P2,3 bp2 broadening distally to about 1½ x as wide as proximal margin; postero-distal margin of P2, P3 bp2 with three or more spiniform processes (1).

**FEMALE** Ur four-segmented; Ro of two short, rigid spiniform processes. P5 uniramous, three-segmented, essentially symmetrical, 3P5 with terminal bifid process (1).

**MALE** Ur five-segmented, ansgt reduced; Ro reduced to a single median, ventrally protruding knob or not well developed. P5 uniramous, asymmetrical; long leg somewhat styliform, five-segmented, terminal segment short, first segment more than twice as long as shorter leg (1).

**Comments:**

This genus has been completely revised (1).

**References:**

1) Frost and Fleminger, 1968
12.3.1 Clausocalanus aruicornis (Dana, 1849)

Synonymy:

Calanus aruicornis: Dana (1849)
Clausocalanus aruicornis forma major: Tanaka (1956b)

Morphology:

Pro fusiform; Hd and PLC rounded; Al short (1).

FEMALE TL 0.9-1.3 mm; Ur shorter than 1/3 Pro; Ro in lateral view short, thick at base, usually straight or slightly curved; ventral margin of gnsgt only slightly protruding, gnsgt more than 1.5 x Ur3; gnsgt dorsal lobe elongate, arising from anterior edge of ventral lobe; P5 uniramous, 3P5 at least twice length of 1P5 (1).

MALE TL 1.0-1.6 mm; Ur longer than 1/3 Pro; Hd rounded, may appear flattened anteriorly; Ro in lateral view knoblike and protruding ventrally; P5 uniramous; Lft P5 longer than Ur, rt P5 reduced to small three-segmented knob; seminal vesicle extends within Pro to a point anterior to the point of attachment of the P1 (1).

Separable from other members of the genus found locally by the point of origin of the dorsal lobe of the gnsgt (arises from anterior edge of ventral lobe) and the relative length of the m Pro (less than 5.7 x as long as Ur2).

Distribution and Occurrence:

Some distributional records may be suspect in light of a recent revision of the genus (1); nevertheless, the species appears to be widespread in tropical and subtropical regions. Rare locally, with a single record from samples in the Institute of Ocean Sciences collection.

Life History:

Juveniles undescribed, key valid for adults only.

References:

1) Frost and Fleminger, 1968
Clausocalanus arcuicornis
from Frost and Fleminger, 1968
12.3.2 **Clausocalanus lividus** Frost and Fleminger, 1968

**Synonymy:**

*Clausocalanus arcuicornis* Fleming (1964)

**Morphology:**

Hd, PLC rounded; A1 short; three thoracic segments; P3 bp2 with three prominent spiniform processes along posterior distal margin (1).

**FEMALE** TL 1.26-1.77 mm; Ur shorter than 1/3 Pro; Ro in lateral view long, thick, usually straight, tapered uniformly; gnsgt not protuberant ventrally, and 1.5 x Ur3; gns gt ventral lobe large in lateral view, with some portion usually anterior to origin of dorsal lobe; dorsal lobe thick, extending towards dorsal margin of gns gt; 3P5 less than 2.0 x 1P5 (1).

**MALE** TL 1.13-1.45 mm; Ur longer than 1/3 Pro; Ro in lateral view knoblike and protruding ventrally; Ift P5 longer than Ur; rt P5 reduced; Ur2 longer than 1.35 x 2P5; seminal vesicle does not extend as far as point of attachment of P1 (1).

Separable from other local members of the genus by the relative length of the f 3P5 (less than 2.0 x 1P5) and the m Ur2 (longer than 1.35 x 2P5).

**Distribution and Occurrence:**

Subtropical, circumglobal, apparently biantitropical in the Pacific (1). Locally, rare, but reported from the Strait of Juan de Fuca (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**References:**

1) Frost and Fleminger, 1968
2) Chester et al., 1980
Clausocalanus lividus

from Frost and Fleminger, 1968
12.3.3  **Clausocalanus parapergens**  Frost and Fleminger, 1968

**Synonymy:**

*Clausocalanus arcuicornis*: Esterly (1924)

*C. pergens*: Tanaka (1960); Fleminger (1964)

**Morphology:**

Hd, PLC rounded; P3 bp2 with three prominent spiniform processes along posterior distal margin (1).

**FEMALE**  
TL 0.97-1.38 mm; Ur less than 1/3 Pro; Ro in lateral view usually short, thick, curved posteriorly; gnsqt slightly swollen, ventral margin undulant; gnsqt longer than 1.5 x Ur3; in lateral view, gnsqt dorsal lobe bulb-shaped and arising posterior to anterior margin of ventral lobe; f 3P5 longer than 2.0 x 1P5.

**MALE**  
TL 0.97-1.15 mm; Pro similar to *C. arcuicornis*; Ro in lateral view knobble like and protruding ventrally; seminal vesicle does not extend as far forward as point of attachment of P1 (1).

Separable from other local member of the genus by the relatively long f3P5 (longer than 2.0 x 1P5), the point of origin of the gnsqt dorsal lobe (posterior to anterior margin of ventral lobe), the relative length of the mUr2 (less than 1.35 x 2P5) and the relative length of the mPro (greater than 5.7 x Ur2).

**Distribution and Occurrence:**

Widespread in tropical and subtropical areas (1). Locally, recorded from the Strait of Juan de Fuca (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**References:**

1) Brodsky, 1950
12.4.1 *Ctenocalanus vanus* Giesbrecht, 1888

**Morphology:**

Hd and PLC rounded; P2,3 exp3 deeply indented at point of attachment of outer edge spines; Ro of two thin filaments; CR short; A2 exp at least 1.5 x enp (1).

**FEMALE**  TL 1.1-1.4 mm; A1 exceed TL; P5 present on left side only, uniramous, reduced and three-segmented (1).

**MALE**  TL 0.9-1.3 mm; P1 exp lacking outer spines; A1 with thickened basal segments; P5 present on left side only, uniramous, five-segmented; rt P5 occasionally present as small knob (1).

**Distribution and Occurrence:**

Extremely widespread; recorded from the Arctic, Atlantic, Pacific, and Indian Oceans (2). Locally, recorded from the Strait of Juan de Fuca (3).

**Life History:**

Juveniles undescribed, but the deeply indented spines on the P3 and P4 exp should be present, and diagnostic, in all copepodite stages older than the C111.

**Comments:**

Esterly's (4) species from the California coast does not conform completely with Giesbrecht's original description of *C. vanus*; however, Esterly concludes that the differences are not sufficient to erect a new species.

**References:**

1) Brodsky, 1950  
2) Vervoort, 1963  
3) Chester et al., 1980  
4) Esterly, 1924
Ctenocalanus vanus

from Esterly, 1924; Rose, 1933; Brodsky, 1950
13.1 *Spinocalanus* Giesbrecht, 1888

**Morphology:**

PLC and Hd rounded; Ro absent; A2 exp longer than A2 enp; CR and caudal setae sometimes asymmetrical. P1 expl with outer distal spine; P3,4 enp3 usually with two outer setae; posterior surface of P1-P4 may have rows of spines (I).

**FEMALE** A1 usually exceeding CR by 1-4 segments. P2-P4 exp2 distal anterior surface with one row of spinules; P2-P4 enp2 posterior surface with two rows of spines, one row sometimes reduced to small spinules. P4 bpl with transverse row of setules; P5 absent (I).

**MALE** Armature of P1-P4 generally similar to corresponding female. P4 bpl without transverse row of setules; P5 short, slender, biramous and usually asymmetrical (I).

The lack of a Ro and the rounded Hd and PLC separate this genus from all others in the area. Note, however, that the rostral area is difficult to see and must be carefully examined to ensure proper identification. Some earlier authors (2, 3) consider *Spinocalanus* to be a genus in the family Pseudocalanidae, but here we follow more recent precedence (1, 4) and place the genus within its own family, Spinocalanidae.

3) Tanaka, 1956b
4) Farran and Vervoort, 1951g (Fiches, Sheet 39)
13.1.1 Spinocalanus brevicaudatus Brodsky, 1950

Synonymy:

Spinocalanus longicornis: Sars (1901)
S. abyssalis: Sars (1903); With (1915); Rose (1933); Tanaka (1937: male only); Davis (1949b); Farran and Vervoort (1951: in part)
S. major: Esterly (1906)
S. pseudospinipes: Brodsky (1950)
S. similis var. profundalis: Brodsky (1955: female only)

Morphology:

Hd rounded in dorsal view; PLC rounded; PI expl with outer edge spine, exp3 posterior surface not spinose; Ro absent; P2 enp2 with one seta on outer margin; A2 expl with two setae (1).

FEMALE TL 1.4-2.4 mm; Pro:Ur ratio 3.0-4.0; gnsgt as long as wide, protruding ventrally; A1 exceeds TL; P5 absent (1).

MALE TL 1.5-1.9 mm; A1 reach Ur2; Pro:Ur ratio about 2.3; P5 biramous, rt side slightly more robust than lt; all rami tapering strongly towards apex, enp and exp subequal (1).

S. brevicaudatus is separable from other local members of the genus by the absence of spines on the posterior surface of the PI exp3 of the adult, and the presence of two setae on the A2 expl.

Distribution and Occurrence:

The species is widely distributed and has been reported from the North and Central Pacific, Indian and Atlantic Oceans and the Caribbean Sea (1). Locally, widespread in the study area, including the Strait of Juan de Fuca (2) and Strait of Georgia (3).

Life History:

The male CV has been briefly described (4). The remaining juvenile stages are undescribed, but the characters used in the key should allow partial identification of juveniles. Some confusion may arise with the juveniles of S. horridus, since the characters separating S. brevicaudatus and S. horridus are in part confined to the adult.

References:

1) Damkaer, 1975
2) Chester et al., 1980
3) Fulton, 1972

Spinocalanus brevicaudatus

from Semenova, 1962; Damkaer, 1975
13.1.2 Spinocalanus horridus Wolfenden, 1911

Synonymy:

Spinocalanus abyssalis: Tanaka (1937: in part); Minoda (1971: in part)
S. stellatus: Brodsky (1950); von Vaupel-Klein (1970)
S. spinipes: Brodsky (1950; female only)
S. dorsispinosus: Brodsky (1950)
S. longispinus: Brodsky (1950)
S. spinosus: Tanaka (1956b)

Morphology:

Hd, PLC rounded; Pl expl with outer edge spine; Ro absent; P2 enp2 with one seta on outer margin; A2 expl with two setae; Pl exp3 posterior surface spinulose (1).

FEMALE TL 1.95-3.00 mm; thoracic segments spinulose near lateral margins; Pro:Ur ratio about 2.7; gnsgt just longer than wide, protruding ventrally; A1 just exceeds TL (1).

MALE TL 2.0-2.9 mm; Pro:Ur ratio about 1.7; A1 reach end Pro; P5 biramous, exp longer than enp; rami elongate, tapering distally (1).

Separable from other local Spinocalanus by the presence of one seta on the outer edge of P2 enp2 and the presence of spines on the posterior surface of the Pl exp3 in the adult. May be difficult to separate from S. brevicaudatus in younger stages.

Distribution and Occurrence:

Widely distributed in cold waters. Reported from the Arctic, Pacific, and Atlantic Oceans and Antarctic region (1). Locally, rare but reported from the Strait of Juan de Fuca (2) and from the northeastern Pacific (3). A deep-living species not usually abundant inshore.

Life History:

The mP5 has been described for the CV. The rami are short and stout, with small apical spines. The length of the CV is reported as 1.95-1.97 mm from Arctic specimens (1). Other juveniles are undescribed. The characters used in the key are valid for the adults only.

References:

1) Damkaer, 1975
2) Chester et al., 1980
3) von Vaupel-Klein, 1970
Spinocalanus horridus
from Damkaer, 1975
13.1.3  *Spinocalanus longicornis*  Sars, 1900

**Synonymy:**

*Spinocalanus schaudinni*: Mrazek (1902); van Breemen (1908: in part)
*Spinocalanus abyssalis* var. *pygmaeus*: Farran (1926)
*Spinocalanus parabyssalis*: Park (1970: in part); Grice (1971)

**Morphology:**

Hd, PLC rounded; Plexp1 with outer edge spine; P2 enp2 lacking setae on outer edge; A2 expl with one seta; posterior surface of PI exp3 lacking spines (1).

**FEMALE**  
TL 0.88-1.30 mm; Pro:Ur ratio about 3.5; gnsgt slightly wider than long, protruding ventrally; A1 exceed TL (1).

**MALE**  
TL 1.0-1.4 mm; Pro:Ur ratio about 2.0; A1 shorter than Pro; P5 biramous, reach distal margin of Ur2, exp longer than enp, enp reduced to a single segment, exp three-segmented; Ift P5 slightly more robust than rt (1).

Separable from other local members of the genus by the lack of setae on the outer edge of P2 enp2 and the presence of only one seta on A2 expl.

**Distribution and Occurrence:**

Widely distributed, with records from the Arctic, Pacific and Atlantic Oceans, and the Mediterranean and Caribbean Seas (1). Locally, rare but recorded from the Strait of Juan de Fuca (2) and northeastern Pacific (3).

**Life History:**

The P5 of the CV male has been described. Both rami are short and stout, segmentation of the exp is incomplete and the enp is reduced. The CV TL is 0.88-0.95 mm (1). Other juvenile stages have not been described. The characters used in the key should allow identification of the CV and possibly CIV.

**Comments:**

This species may often be undersampled and/or overlooked due to its small size.

**References:**

1) Damkaer, 1975  
2) Chester et al., 1980

**References:**

1) Bradford, 1971a  
2) Brodsky, 1950
14.1.1 Aetideus divergens Bradford, 1971

**Synonymy:**

Aetideus armatus: Campbell (1929b); Davis (1949b); Brodsky (1950); Cameron (1957); Legare (1957); Fulton (1972)

**Morphology:**

PLC with acute projections; A1 approximately equal to TL; PI exp three-segmented; P2 exp one-segmented (1).

**FEMALE** TL 1.6-1.9 mm; Ro small, with two basally-separate, parallel filaments; PLC barely extend past distal margin gnsgt; PLC diverge outwards; dorsal and ventral lobes of gnsgt connected by long, thick tube (1).

**MALE** TL 1.25-1.43 mm; PLC extend well past Ur1; Ro absent; ansgt reduced; P5 present on lft side only (1).

Separable from A. pacificus by the smaller size and slightly divergent PLC.

**Distribution and Occurrence:**

The only confirmed record is from the northeastern Pacific (1); however, based on a possible synonymy with A. armatus from the San Juan Islands (2) the species appears to be widely distributed and common in the study area.

**Life History:**

Juveniles undescribed; however, the characters used to identify the species should allow identification of the CV.

**Comments:**

Aetideus divergens was described as a new species from specimens taken in the northeastern Pacific Ocean (1). The type locality of the species is 52°02'N, 132°53'W, just outside of the present study area. Park (2) synonymizes A. divergens with A. armatus from the San Juan Islands, and it is likely that references to A. armatus refer instead to A. divergens.

**References:**

1) Bradford, 1971a
2) Park, pers. comm.
Aetideus divergens
from Tanaka, 1957; Bradford, 1971
14.1.2  *Aetideus pacificus* Brodsky, 1950

**Synonymy:**

*Aetideus armatus* (?): Esterly (1905)

**Morphology:**

**FEMALE** TL 2.2-3.0 mm; Pro:Ur ratio approximately 3.4; PLC acute, slightly convergent in dorsal view, PLC points do not reach distal margin gns; Ro of two basally-separate, distally diverging filaments; Al exceed TL; Pl exp three-segmented; P2 enp one-segmented; P5 lacking (1, 2).

**MALE** undescribed.

Separable from *A. divergens* by its larger size and the tendency of the PLC to curve toward the midline. Al usually two segments beyond the CR. Segmentation of Pl and P2 rami may be partially obscured by fusion, and must be examined carefully.

**Distribution and Occurrence:**

Reported from the central and western North Pacific, Sea of Okhotsk and Bering Sea (1). Brodsky (1) suggests Esterly's (3) record of *A. armatus* from the California coast conforms with *A. pacificus*; however, Bradford (4) disagrees. Locally, reported as deep and rare in the Strait of Georgia (5) and also reported from the Strait of Juan de Fuca (6).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

Although the species was originally described by Brodsky (1), his description was incomplete and Park's (2) revised description should be consulted. The species requires further taxonomic study to confirm its status.

**References:**

**References:**

1)  Bradford and Jillett, 1980
Bradyidius saanichi Park, 1966

Morphology:

PLC acute, Hd rounded; A1 short, terminating near end of Pro; A2 exp longer than enp; CR relatively short; PI expl with outer distal seta; three thoracic segments (1).

FEMALE TL 2.33-2.56 mm; Pro:Ur ratio approximately 3.4; Ro with two strongly divergent rami; PLC extensions strong, directed pos-ttero-dorsally and ending near distal margin of gnsgt; P5 lacking (1).

MALE TL 2.01-2.24 mm; Pro:Ur ratio about 2.4; PLC slightly curved downward and thus directed more posteriorly than in female; points smaller; P5 biramous, asymmetrical; P5 enp reduced to a single long, thin segment; rt P5 exp two-segmented, lft exp three-segmented (1).

B. saanichi is similar to but smaller than B. similis, and the PLC reach the distal margin of the female gnsgt versus the midpoint in B. similis. Note also that B. similis is rare in the study area; there has been only one, unconfirmed, report of its presence (2).

Distribution and Occurrence:

Not recorded outside the area covered by this manual. Fulton (3) records the species as common in Saanich Inlet, the type locality, but rare in the Strait of Georgia. Also reported from the Strait of Juan de Fuca (4).

Life History:

Juveniles undescribed; however, the CV and possibly CIV should be separ-able based on the characters used herein. Note that all copepodite stages of B. similis have been described (5) (see page 15).

Comments:

One of the few species apparently endemic to the study area.

References:

1) Park, 1966a

Bradvidius saanichii
from Park, 1966
14.2.2 Bradyidius similis (Sars, 1903)

Morphology:

PLC extended acutely; Hd rounded in dorsal view; A1 short; A2exp longer than enp; Plexpl with outer distal spine; three thoracic segments (1).

**FEMALE** TL 2.7-3.0 mm; PLC reach midpoint of gnsgt; Ro with two slightly divergent rami (1, 2).

**MALE** TL 2.4-2.9 mm; PLC acute, but reduced compared to female; P5 biramous, enp reduced to a single, elongate segment; rt exp longer than Ift (1, 2).

Similar to, but distinguishable from B. saanichi by the larger size and the length of the PLC (reach only midpoint of gnsgt vs distal edge for B. saanichi).

Distribution and Occurrence:

Arctic Ocean and North Atlantic Ocean, Bering and Okhotsk Seas (2). Locally, only one, unconfirmed report (3).

Life History:

All copepodite stages are fully described and are illustrated on page 15 (2). CV and CIV stages are identifiable using the characters described herein; however, they may be confused with B. saanichi juveniles, especially in the CIV.

1) Brodksy, 1950
2) Vervoort, 1952d (Fiches, Sheet 44)
14.3.1  

**Chiridius gracilis** Farran, 1908

**Morphology:**

Hd rounded, PLC acute; Ro absent; A1 approximately equals Pro length; A2 exp twice enp (1, 2)

**FEMALE** TL 2.4-3.1 mm; (Fulton (3) lists 4.8 mm as an upper size limit); Pro:Ur ratio about 3.0; PLC extend beyond midpoint of gns gt; gns gt symmetrical in dorsal view, about as long as wide; PI expl with outer distal spine (1)

**MALE** TL 2.33-2.57 mm; Pro:Ur ratio about 3.4, Pro with lateral bulges at level of insertion of A2; PLC bend slightly inward and reach posterior margin of Ur1; P5 uniramous, rt and Ift sides elongate; rt mP5 four segmented, distal segment falciform; Ift mP5 five segmented, shorter than Ift (2)

Separable from the larger but otherwise similar female of *C. polaris* by lack of segmentation in the P2 enp.

**Distribution and Occurrence:**

A deep water copepod found in temperate to tropical waters of all oceans (1). Locally, widespread. Common in the Strait of Georgia and throughout the study area in relatively protected waters (3). Rare in Queen Charlotte Sound and Hecate Strait (4).

**Life History:**

All copepodite stages have been well described (2). Note that the CI-CIII do not have acute PLC. Older stages may be identified to genus by the key, and *C. gracilis* can be separated from *C. polaris* in the female (CV and CIV). Stages older than CIII can be sexed by the presence of a P5 in the male.

**Comments:**

Much more common than *C. polaris*. Park (1) indicates partial fusion of PI expl1,2 in the female; however, Maclellan and Shih (2) show these two segments as separate. We follow the latter which deals with temperate samples and is a more complete treatment.

**References:**

1) Park, 1978
2) MacLellan and Shih, 1974
3) Fulton, 1972
4) Cameron, 1957
Chiridius uracilis from Park, 1975; 1978

Chiridius gracilis from Park, 1975; 1978
Chiridius polaris Wolfenden, 1911

Morphology:

**FEMALE** TL ca. 3.5 mm; Hd rounded; PLC produced as acute points, terminating anterior to midpoint of gnsgt; Ro lacking; Pros:Ur ratio about 3.0; gns gt ventral process small; A1 reach midpoint Ur2; A2 exp twice enp; P1 bp2 with small spinule at outer distal corner; P2 enp segments poorly separated (1).

**MALE** Undescribed.

Resembles C. gracilis, a smaller copepod, but the fP2 enp has two segments, while in C. gracilis the fP2 enp is unsegmented. Also, in C. gracilis the PLC extend past the midpoint of the gnsgt.

Distribution and Occurrence:

North Pacific, Antarctic waters (1). Rare locally, but occasionally present in samples from the northern part of the region (2).

Life History:

Juveniles undescribed, key valid for adults only. Note that all copepodites of Chiridius gracilis, a similar species, have been described (3).

Comments:

Much rarer in the study area than C. gracilis.

3) MacLeLLan and Shih, 1974
Chiridius polaris
from Vervoort, 1957
14.4  **Gaidius** Giesbrecht, 1895

**Morphology:**

Hd without cephalic process; Ro simple, often with a minutely bifurcated tip. PLC rounded or with spiniform or conical process of varying size and shape. P1 expl without spine; P4 bpl with one or more rows of spiniform or bladelike structures (1, 2).

**FEMALE** mxp bpl with or without lamelliform process on external margin. P5 absent (1, 2).

**MALE** Al bearing well-developed aesthetascs. Mouthparts reduced. Mxp bpl without lamelliform process; A2 rami subequal. P5 asymmetrically biramous, each with one segmented enp; lft P5 exp three-segmented; rt exp two-segmented, prehensile (1, 2).

**Gaidius** and **Gaetanus** are identical except for the cephalic spine of **Gaetanus.** Park (2) considers the variability of this character to be such that it does not adequately separate the genera, and he has proposed that the genera be united into the single genus **Gaetanus.** We have retained both genera.

**References:**

1) Brodsky, 1950
2) Park, 1975a
14.4.1  **Gaidius minutus**  Sars, 1907

**Synonymy:**

*Gaidius columbiae*: Park (1967), Fulton (1972)
*Chiridius tenuispinus*: Campbell (1929b)

**Morphology:**

PLC produced posteriorly as blunt processes; Ro small, bifurcate at its tip; A1 short, terminating near PLC; P1,2 segmentation: 2-1/3-1; P1 expl with outer distal spine and with incomplete suture (1).

**FEMALE**  TL 2.97-3.20 mm; Pro:Ur ratio about 3.5; P5 lacking; A2 about 1.5 x enp (1).

**MALE**  TL 2.72-3.10 mm; Pro:Ur ratio about 2.7, A2 expl just longer than enp; P5 uniramous asymmetrical; rt P5 heavier than lft; enp one-segmented, rt expl two-segmented, lft expl three-segmented (1).

The blunt processes on the PLC are diagnostic and separate the species from all other similar taxa.

**Distribution and Occurrence:**

Described from the northeastern Atlantic, the Indian and the Pacific Oceans (1). Locally, abundant and widespread in the study area, but not ubiquitous (1,2,3).

**Life History:**

Juveniles undescribed, however the blunt processes of the PLC should be diagnostic for the CV and CIV.

**Comments:**

Park (1) described *G. columbiae* as a new species from the Strait of Georgia, but later synonymized *G. columbiae* with *G. minutus* (4). However, *G. columbiae* and *G. minutus* do not agree in all characters. In particular, *G. minutus* is reported as having a TL less than 2.72 mm in both sexes (2) and the PLC processes in *G. columbiae* are uniformly short and blunt, while male *G. minutus* are armed with spiniform processes. In deference to Park's judgement, we accept his synonymy.

**References:**

1) Park, 1967b
2) Campbell, 1929b
3) Fulton, 1972
4) Park, 1975a
Gaidius minutus
from Park, 1967
14.4.2  Gaidius pungens  Giesbrecht, 1895

**Synonymy:**

Gaidius tenuispinis: Tanaka (1957: male only)

**Morphology:**

PLC acute; Hd rounded; PI exp 2-segmented; P2 enp 1-segmented (1,2).

**FEMALE**  TL 2.6-3.8 mm; PLC reach past midpoint gnsgt; Ro undescribed; A1 reaches end Pro; P4 bp2 armed with about 12 long spines (1).

**MALE**  TL 2.0-2.3 mm; Pro:Ur ratio about 3.3; Ro small, with bifurcate apex; A1 reaches distal margin Ur4; P1 exp1 with minute spine and one short, fine seta; P5 biramous, enp reduced to single elongate segment, exp three-segmented (2).

Similar in the male to G. variabilis but smaller and differing in the lack of segmentation in the P2 enp. Note that the PI exp of G. variabilis may be incompletely separated into three segments, in which case a partial separation between the PI exp1 and PI exp2 should be visible.

**Distribution and Occurrence:**

Reported from all oceans, primarily deep-living (3). Locally, rare but recorded in the Strait of Georgia and occasionally from other coastal stations (4).

**Life History:**

Juveniles undescribed, however the CV should be identifiable on the basis of PI exp/P2 enp segmentation.

**Comments:**

There is confusion in the literature concerning the synonymy of this species with Gaidius tenuispinus Sars. Davis (5) considers the two species to be the same, but his specimens conform more closely to G. tenuispinus in having a two-segmented P2 enp, versus an unsegmented P2 enp in G. pungens. Bradford and Jillett (3) support Wolfenden's (6) assertion that Giesbrecht's (7) samples of G. pungens are nevertheless identical to Sars' G. tenuispinus; however, they describe the P2 enp as one-jointed with an obvious fusion line and describe the PI exp as three-segmented in the adult. Tanaka and Omori (2) show the PI exp as two-segmented and show no fusion lines in the P2 enp. We follow Brodsky (1), Tanaka and Omori (2), and Park (8) in considering the species to be distinct.

8) Park, 1975
Gaidius pungens

from Bradford and Jillet, 1960; Tanaka, 1970
14.4.3  *Gaidius variabilis* Brodsky, 1950

**Synonymy:**

*Gaidius moderatus*: Tanaka (1957)

**Morphology:**

PLC acute; Hd rounded; Ro robust, minute bifid tip; A1 just shorter than TL; P1 exp three-segmented, exp 1 with incomplete suture; P2 exp two-segmented (1,2).

**FEMALE** TL 3.2-3.8 mm; Pro:Ur ratio about 3.8; PLC variable, extend about 1/3 length gnsgt; gnsgt as long as wide (2).

**MALE** TL 3.0-3.6 mm; PLC reach midpoint Ur1; ansgt reduced; P5 biramous, enp one-segmented; rt enp heavy, expanded in distal third; lt enp elongate, thin (1,3).

Separable from other members of the genus by the acute, usually thin (but variable) spines of the PLC, P1 exp/P2 exp segmentation (3 and 2 respectively) and length of male A1, which reaches distal margin of Ur3 (but note Brodsky's (1) description, in which male A1 is shorter than this).

**Distribution and Occurrence:**

Northwestern Pacific, Sea of Okhotsk, Bering Sea, Japanese waters (1,2). Locally, recorded as common in the Strait of Georgia (4) and also seen in the Strait of Juan de Fuca (5). Occasionally seen in other B.C. coastal waters.

**Life History:**

Juveniles undescribed, however, the CV should be identifiable on the basis of leg segmentation and PLC.

**Comments:**

Similarities among members of this family, and the variability of the characters, make routine differentiation difficult. Fortunately, only one species, *G. minutus*, is abundant and widespread locally.

**References:**

1) Brodsky, 1950  
2) Tanaka and Omori, 1970a  
3) Tanaka, 1957a  
4) Fulton, 1972  
5) Chester et al., 1980
Gaidius variabilis

from Brodsky, 1950; Tanaka and Omori, 1970; von Vaupel-Klein, 1970
Gaetanus Giesbrecht, 1888

Morphology:

Hd usually with cephalic process; Ro simple, often with a minutely bifurcated tip. PLC rounded or with spiniform or conical process of varying size and shape. P1 expl without spine, P4 bpl with one or more rows of spiniform or bladelike structures (1, 2).

**FEMALE** mxp bpl with or without lamelliform process on external margin. P5 absent (1, 2).

**MALE** Al bearing well-developed aesthetascs. Mouth parts reduced; mxp bpl without lamelliform process; A2 rami subequal. P5 asymmetrically biramous, each with one-segmented enp; lft P5exp three-segmented; rt exp two-segmented, prehensile (1, 2).

Gaetanus and Gaidius are identical except for the cephalic spine of Gaetanus. Park (2) considers the variability of this character to be such that it does not adequately separate the genera, and he has proposed that the genera be united into the single genus Gaetanus. We have retained both genera to better reflect current usage.

14.5.1 **Gaetanus intermedius** Campbell, 1930

**Synonymy:**
- armiger: Davis (1949b)
- G. simplex: Brodsky (1950)

**Morphology:**
Hd rounded in profile, but usually armed on the midline with a small cephalic spine pointing obliquely forward; PLC produced as spiniform processes; Al just exceed PLC (1).

**FEMALE** TL 2.90-3.51 mm; Pro:Ur ratio about 4.3; PLC extend just beyond midpoint of gnsgt; dorsally, gnsgt symmetrical; laterally, genital prominence pronounced; P4 bpl with row of spiniform structures on internal margin (1).

**MALE** TL 2.65-3.10 mm; Pro:Ur ratio about 3.0; cephalic spine small, occasionally lacking; PLC terminate anterior to distal margin gnsgt; P4 bpl without spiniform structures; P5 asymmetrical; rt enp less than ½ rt expl, lft enp just shorter than lft expl (1).

**G. intermedius** is smaller with a less prominent cephalic spine than other local members of this genus. Park (1) suggests that the male may occasionally lack a cephalic spine, in which case it is still identifiable by size, the acute spines on the PLC and the clearly two-segmented P2 enp and P1 exp. Note that the cephalic spine is small, and may lie flat against the head, difficult to see. It is best viewed in profile.

**Distribution and Occurrence:**
Reported from the Seas of Japan and Okhotsk, the Bering Sea and northeastern Pacific (1). Usually rare in the study area (1,2,3,4).

**Life History:**
Shan (2) gives sizes and brief descriptions of all copepodite stages. The presence of a cephalic spine and the relatively small size should separate this species from all other taxa in at least the CIV and CV.

Total Length (mm):
- fCV 2.70
- fCIV 2.00
- CIII 1.55
- CI 0.85
- mCV 2.65
- mCIV 2.00
- CII 1.15

**Comments:**
Campbell's (3) original description was incomplete, and the species was redescribed by Park (1); Park (5) combines the genera *Gaetanus* and *Gaidius* and renames *G. intermedius* as *G. campbellae* to avoid homonymy with *Gaidius intermedius* Wolfenden, 1905. Here we retain the separation of these two genera.

**References:**
1) Park, 1973  
2) Shan, 1962  
3) Campbell, 1930  
4) Davis, 1949b  
5) Park, 1975
Gaetanus intermedius
from Park, 1973
14.5.2  **Gaetanus miles** Giesbrecht, 1888

**Synonymy:**

- *Gaetanus secundus*: Esterly (1911)
- *G. ferox*: With (1915)

**Morphology:**

A1 at least twice as long as TL; P1 exp and P2 enp two-segmented, P1 expl with incomplete suture; A2 exp about 1.2 x enp (1).

**FEMALE** TL 3.2-4.7 mm; cephalic spine long, erect; PLC acute, diverging slightly and terminating beyond midpoint of gns gt; Pro: Ur ratio about 4.6; P4 bpl with row of spines on inner margin (1,2).

**MALE** TL 3.0-3.55 mm; Hd spine reduced to small crest, PLC rounded; A1 approximately equals total length (3).

**Distribution and Occurrence:**

Wide-ranging over the tropical, subtropical, and temperate regions of the world's oceans. Usually deep, but often in near-surface waters (4). Locally, rare but recorded in Queen Charlotte Strait (5).

**Life History:**

Juveniles undescribed, although Vervoort (4) gives the lengths of the CV male and female, which he characterizes as easily recognizable by the long A1 and prominent head spine. Grice (6) briefly describes the CV male P5. Size ranges: CV female 2.5-12 mm, CV male 3.0 mm.

**Comments:**

Likely an indicator of intruding oceanic water containing a significant proportion of southern water (i.e. originating near the California coast).

**References:**

1) Tanaka, 1957b
2) Brodsky, 1950
3) Bradford and Jillett, 1980

5) Stone, 1980
6) Grice, 1962
Gaetanus miles

from Grice, 1961; Park, 1975; Bradford and Jillet, 1980
14.5.3 Gaetanus pileatus Farran, 1903

Synonomy:

Gaetanus caudini: Wolfenden (1904); Sars (1905)
G. unicorne: Esterly (1906)
G. recticornis: Wolfenden (1911)
G. clarus: Esterly (1906)

Bradford and Jillet (1980) point out that Sars' (1925) plate 17 may be confused, and Fig. 6, identified as the mP5 from G. pileatus, is in fact the mP5 of G. latifrons.

Morphology:

PLC acute, cephalic spine large, obvious; A2 rami subequal; PI exp two-segmented (1)

FEMALE TL 4.90-6.65 mm; Pro:Ur ratio approximately 4.2; cephalic spine erect; PLC extend to midpoint gnsrt; A1 exceed TL; gnsrt as long as wide; in lateral view, dorsal profile of gnsrt constricted anteriorly (1).

MALE TL 4.44-5.08 mm; cephalic spine directed antero-ventrally, PLC reduced; P5 biramous, enp one-segmented, exp three-segmented (2).

Unique in its large size and large cephalic spine.

Distribution and Occurrence:

Widely distributed over the tropical, subtropical and temperate zones of the world oceans, but nowhere abundant (3). Locally, rare but recorded from Queen Charlotte Strait (4).

Life History:

Juveniles undescribed; however the CIV and CV should be separable by size and the large cephalic spine.

Comments:

Likely an indicator of intruding water composed in part of water of southern origin (i.e. near the California coast).

References:

1) Tanaka, 1957b 3) Vervoort, 1963
2) Park, 1978 4) Stone, 1980
Gaetanus pileatus

from Park, 1978

231
Euchirella Giesbrecht, 1888

Morphology:

Hd usually rounded, occasionally with triangular crest; PLC rounded; Ro single, occasionally absent. Thorax three or four-segmented; Ur thick; ansgt and CR short, CR setae asymmetrical. A2 enp much shorter than A2 exp. Maxr rami short, inner lobe with massive, uncinate bristles. P1,2 segmentation: 2-1/3-1; P1 expl with spine. P4 bpl with one or more spines at the base of inner distal setae.

FEMALE Ur four-segmented; gns gt in dorsal view usually asymmetrical, ventral swelling distinct, occasionally large. P5 absent (1, 2).

MALE Ur five-segmented; mouthparts reduced. P5 biramous, asymmetrical; lft P5 enp small, one-segmented; lft P5 exp three-segmented; rt P5 enp strongly developed, exp two-segmented, terminal segment with teeth or plates along internal margin (1,2).

The short CR and Ur separate this genus from others with rounded PLC.

1) Brodsky, 1950
2) Vervoort, 1952g (Fiches, Sheet 47)
14.6.1  *Euchirella curticauda* Giesbrecht, 1888

**Synonymy:**

- *Euchirella curticauda var atlantica*: Wolfenden (1904); Pearson (1906)
- *E. atlantica*: Wolfenden (1905)
- *Scolecinthrix cristata* (male): Thompson (1903)
  
Vervoort (1963) reviews the genus and provides extensive references to *E. curticauda*.

**Morphology:**

PLC rounded; Hd cristate, crest somewhat triangular in lateral view; Ro small, single; Al approximately equal Pro length; CR short (1, 2).

**FEMALE** TL 3.3-4.5 mm; gns gt symmetrical in dorsal view, slightly swollen laterally; length of gns gt equals ½ length Ur; Ur 3 with small ventral projection; Pro:Ur ratio about 6.0; A2 exp 4x enp; P4 bpl with row of usually more than 10 spines at base of inner marginal seta (1, 2).

**MALE** TL 3.1-4.3 mm; A2 exp 1.4 x enp; P5 biramous; Ift P5 enp one-segmented and about ½ expl; exp3 small, originating subterminally to form a chela with a long distal process of exp2; rt 5enp one-segmented, club-shaped, approximately equal to rt expl; rt P5 non-chelate (1, 2).

The short CR, rounded PLC and crestate head separate this species from most others. Separable from similar species of *Euchirella* by the symmetrical gns gt in the female and non-chelate rt P5 in the male respectively.

**Distribution and Occurrence:**

Widespread in the Atlantic, Pacific and Indian Oceans, but usually in small numbers. Locally, reported in the vicinity of Cape Flattery (3), and in Queen Charlotte Strait (4).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

A more southerly species along the eastern North Pacific, perhaps indicating northward intrusions of southern water when found off the British Columbia coast.

**References:**

1) Tanaka, 1957b  
2) Park, 1976b  
3) Davis, 1949b  
4) Stone, 1980
Euchirella curticauda

from Brodsky, 1950; Tanaka, 1957; Bradford and Jillett, 1980
14.6.2 Euchirella pulchra (Lubbock, 1956)

Synonymy:

Undina pulchra (male): Lubbock (1856)
Calanus latus (female): Lubbock (1856)
Euchaeta pulchra: Brady (1883: male only); T. Scott (1894)

Morphology:

PLC rounded; A2 exp about 3-4 x enp; Ro single, well developed (1).

FEMALE TL 3.0-3.9 mm; Hd rounded, not cristate; gnsgt asymmetrical in dorsal view, with large protuberance on Ift side, P4 bpl with one or two large spines at base of inner distal seta (1).

MALE TL 3.00-3.16 mm; Hd in dorsal view with a low crest; Ift P5 enp lacking; Ift P5 exp much reduced with respect to rt P5; rt enp and exp both tapering distally, of complex shape but arranged in the form of a chela (1).

Separable from most other local members of the genus by the asymmetrical gnsgt (female) and chelate form of the rt P5 (male). Similar to E. pseudopulchra, but smaller and with less than three spines at the base of the inner marginal seta of P4 bpl. Lacks a crest in the female.

Distribution and Occurrence:

Confirmed records in the Atlantic, from 19°S to 50°N; reported from the Gulf of Guinea, the coasts of Brazil and Chile, and widespread temperate and tropical regions of the Pacific (2). Confusion with E. pseudopulchra in the northeastern Pacific makes distributional records difficult to interpret. Likely rare, and perhaps absent, in the study area.

Life History:

Juveniles undescribed, key valid for adults only.

Comments:

Park re-examined specimens of Euchirella from British Columbia waters and found that they differed substantially from E. pulchra. Accordingly, he designated the British Columbia taxon as a new species, E. pseudopulchra, and suggested that Davis' (3) record of E. pulchra was in fact E. pseudopulchra. Esterly (4) also reported E. pulchra from the west coast of North America, but his figures are not adequate to allow evaluation of his identification. The size of Esterly's specimens conforms to E. pulchra. This species needs further taxonomic and distributional study.

Euchirella pulchra

from Esterly, 1905; Sars, 1925; Park, 1967
14.6.3  **Euchirella pseudopulchra** Park, 1976

**Morphology:**

**FEMALE** TL 4.20-4.35 mm; Ur short, gnsgt asymmetrical, in dorsal view rt profile concave, lft profile convex; CR short; A1 extends to distal margin gnsgt; Hd with a low crest; A2 exp 3-4 x enp; P4 bpl with three spines at base of inner distal seta (1).

**MALE** Undescribed.

Separable from other members of the genus by the cristate head, left sided asymmetry of the gnsgt and presence of three spines in the P4 pbl.

**Distribution and Occurrence:**

Reported only from the northeastern Pacific, specifically the Strait of Georgia, the Strait of Juan de Fuca, Washington Sound, the coasts of northern California, Oregon and Washington, and Queen Charlotte Strait (1,2,3,4). Rare at all inshore stations, and in low numbers offshore.

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

The taxonomy of this species needs clarification. Davis (3) describes both the male and female of *E. pulchra* from the northeastern Pacific, but Park's (1) redescription of the species in this area as *E. pseudopulchra* indicates the male as being undescribed.

**References:**

1) Park, 1976a  
2) Stone, 1980  
3) Davis, 1949b  
4) Fulton, 1972
Euchirella pseudopulchra
from Park, 1976
14.6.4  **Euchirella rostrata** (Claus, 1866).

**Morphology:**

Hd rounded, not cristate; Ro large, single; PLC rounded; Al approximately equal TL; A2 enp less than ½ exp (I).

**FEMALE** TL 2.5-3.9 mm (usually less than 3.5 mm); gnsgt symmetrical in dorsal view, broadly swollen laterally; P4 bpl with row of 5 to 9 spines, diminishing in size towards distal margin of segment (I).

**MALE** TL 2.5-3.0 mm; lft P4 bp2 much longer than rt; P5 rami biramous, enp one-segmented, just shorter than expl; rt exp two-segmented, tapering distally, not chelate (I).

Separable from other local members of the genus by the rounded head, symmetrical gnsgt (female), and non-chelate form of the rt mP5 rami (male). Five or more spines near the base of the inner marginal seta of P4 bpl.

**Distribution and Occurrence:**

Widely recorded from the tropical, subtropical and temperate regions of the world's oceans (2). Locally, rare but reported from the Strait of Georgia and Queen Charlotte Strait (3,4).

**Life History:**

Juveniles undescribed, however, the CV may be separable based on the lack of a crest and the spinulation of the P4 bpl.

**Comments:**

Park (1) describes this and two other local species and comments briefly on their feeding ecology.

**References:**

1) Park, 1976b  
2) Vervoort, 1963  
3) Fulton, 1972  
4) Stone, 1980
Euchirella rostrata
from Bradford and Jillett, 1980
Morphology:

Hd with crest; Ro single, prominent and sharp. PLC wide, with short blunt projections; thorax three-segmented. A1 only slightly longer than thorax; A2 enp at least ½ length of A2 exp. P1 expl with spine; P4 bp2 without spines (I).

**FEMALE** Hd with high, triangular crest confined to head apex. P1 segmentation 2-1; P5 absent (I).

**MALE** Hd with low, wide crest. P1 segmentation 3-1. P5 large, biramous, slightly asymmetrical; exp three-segmented; rt P5 exp3 terminating with a spine, lft P5 exp3 with terminal bundle of bristles on ventral surface (I).

*Some species of Undeuchaeta have cristate heads; however, these species are not found in the study area.*

References:

1) Brodksy, 1950
14.7.1  *Chirundina streetsi* Giesbrecht, 1895

**Synonymy:**

*Euchirella carinata*: Wolfenden (1902, 1903, 1904, 1905, 1911)

**Morphology:**

A large copepod with cristate Hd, rounded or angular PLC and A1 terminating near ansgt; A2 exp 1.6 x enp; CR short; Pl expl with spine at outer distal corner (1).

**FEMALE**  TL 3.6-6.0 mm; Pro:Ur ratio about 3.7; ansgt reduced, gnsgt just less than ½ length Ur; in lateral view gnsgt ventral swelling most pronounced distally (1).

**MALE**  TL 3.8-5.0 mm; Hd crest low, may not be immediately obvious; Pro:Ur ratio about 2.7 (1).

**Distribution and Occurrence:**

Widely distributed in the world's oceans, usually in deep water. Vervoort (2) summarizes the distribution. Locally, recorded in Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed; however, the CV at least should be separable based on size, rostrum and crest.

**Comments:**

Rare in the study area, and except in special circumstances restricted to open water.

* Some species of *Undeuchaeta* have cristate heads; however, these species are not found in the study area.

**References:**

1) Brodsky, 1950
14.8.1 Undeuchaeta bispinosa Esterly, 1911

Morphology:

**FEMALE** TL 4.5 mm; Hd rounded; PLC acutely angular; AI as long as Pro; CR short; Ro single; gns gt with rounded process on rt side; small spine at distal margin of process (about level with genital aperture); small curved spine to rt of genital aperture and group of massive spines on lt distal margin of gns gt; PI expl with outer distal spine; P5 absent(1).

**MALE** The only reported description of the male is by Sewell (2).

Distribution and Occurrence:

Reported from the coast of California (3) and from Queen Charlotte Strait (4). Bradford and Jillett (5) indicate that Sewell (2) described the male of this species from the Indian Ocean.

Life History:

Juveniles undescribed; however, the CV should be separable based on the following features: short CR and AI, single Ro, PI expl spine and possibly acute apices on PLC.

Comments:

Neither Esterly's (3) nor Brodsky's (1) description is complete, and further clarification will require study of the type specimens.

Undeuchaeta bispinosa
from Esterly, 1911
14.9  Pseudochirella  Sars, 1920

**Morphology:**

Thorax four- or five-segmented; Hd almost always without crest; PLC rounded or provided with spine. Ro prominent, single. A1 equal or longer than TL. A2 enp at least ½ length A2 enp. P1,2 segmentation variable usually 2-1/3-1; P4 bpl with 6-14 strong spinules on posterior surface. P2-P4 exp terminal spines with a very strong row of hairs along internal border (1, 2).

**FEMALE** gns gt without spines, P5 absent (1, 2).

**MALE**  P5 biramous, asymmetrical; swollen bpl; enp elongate, one-segmented; lf P5 exp with three short segments, rt enp with two elongate segments (1, 2).

14.9.1 Pseudochirella polyspina Brodsky, 1950

Synonymy:

Pseudochirella spinifera: Brodsky (1950); Tanaka and Omori (1969b); von Vaupel-Klein (1970)
NOT P. polyspina: Tanaka and Omori (1969b: male only)

Morphology:

Hd, PLC rounded; Ro single; A1 approximately equal to TL; A2 exp about \( \frac{1}{2} \) enp; Pl expl with spine (1,2).

**FEMALE** TL 5.65-6.50 mm; Pros:Ur ratio about 3.6; gns gt just less than \( \frac{1}{2} \) Ur; gns gt spinulose along distal and lateral margins; P4 bpl with row of spines on inner margin (1).

**MALE** TL 4.83-5.33 mm; Pros:Ur ratio about 2.8; PLC rounded but may have two small spines on dorsal margin; P5 biramous, rami slender without setae or projections (2).

Distribution and Occurrence:

Reported from the northwestern and northeastern Pacific Ocean, the Bering Sea, Sea of Okhotsk, Sea of Japan, Indian Ocean and Antarctic waters (3). Locally, reported from the Strait of Juan de Fuca (4).

Life History:

Juveniles undescribed; however, the characters used in the key should apply equally to the CV, and perhaps the CIV.

Comments:

The name of this species derives from the heavy spinulation of the female urosome.

References:

1) Tanaka, 1957b
2) Tanaka and Omori, 1969b
3) Park, 1978
4) Chester et al., 1980

252
Pseudochirella polyspina

from Brodsky, 1950; Tanaka, 1957; von Vaupel-Klein, 1970

253
Morphology:

Thorax four-segmented; PLC with acute points; Hd rounded; Ro absent. Posterior borders of Ur segments spinulose. A2 rami subequal. P1 expl with spine; P1-2 segmentation 3-1/3-2; P2-P4 enp posterior surfaces spinulose; P4 spinulation finer and more dense than P2,3; P2,3 bp1,2 with spinule on external margin (I).

**FEMALE** mxp massive and conspicuous; P5 absent (I).

**MALE** Mouth parts reduced; A1 slightly asymmetrical, rt A1 stouter distally and bent backward at about the third distal segment; P5 biramous and asymmetrical, enp one-segmented (I).

The asymmetrical mA1 and spinulation of P1-P4 separate this genus from all others.

References:

1) Koeller and Littlepage, 1976
14.10.1 *Azygokeras columbiae* Koeller and Littlepage, 1976

**Morphology:**

Ro absent; PLC acute; Hd rounded; Al approximately equal to TL; Pl expl with outer distal spine (1).

**FEMALE** TL 2.58-2.84 mm, Pro stout; Pro:Ur ratio about 3.5; PLC points reach midpoint gnsgt; gnsgt large, ansgt reduced (1).

**MALE** TL 2.00-2.10 mm; Pro more slender than in female; rt Al with distal six segments enlarged; Pro:Ur ratio about 3.0; PLC reduced somewhat; ansgt reduced; mouthparts reduced; P5 biramous, lft bpl equal to rt bpl and bp2 combined, enp one-segmented; lft P5 much longer than rt (1).

**Distribution and Occurrence:**

Recorded only from deep water in Bute Inlet, British Columbia (1).

**Life History:**

Juveniles undescribed; however, with the exception of male Al asymmetry the characters used in the key should enable separation of the CV.

**Comments:**

This species is apparently epibenthic, and represents a niche that is poorly sampled by standard zooplankton collecting techniques. More extensive sampling with appropriate equipment might uncover a relatively large and diverse copepod fauna associated with, but living above, the sea bed in the study area.

**References:**

1) Koeller and Littlepage, 1976
Azygokeras columbiae from Köeller, 1974
15.1  **Euchaeta Philippi, 1843**

**Morphology:**

PLC rounded, occasionally bearing a blunt papilla; Hd in lateral profile may show frontal prominence; Ro single, may be prominent. A2 rami subequal. Mxp large, stout and bearing large, curved distal setae adapted for raptorial feeding. Pl,2 segmentation: 2-1 or 3-1.

**FEMALE** gns gt with well developed ventral genital protuberance; may be asymmetrical in dorsal view; P5 absent (1).

**MALE** P5 large biramous and asymmetrical. Enp one-segmented, lft P5 bp swollen more than rt P5 bp (1).

The enlarged raptorial mxp separates this genus from all other local forms.

**Comments:**

Several authors (2, 3, 4, 5) have split this genus into two genera, *Euchaeta* and *Pareuchaeta*; however, we agree with Fontaine (6) and other authors (7, 8) who consider *Pareuchaeta* invalid, and place all species into the genus *Euchaeta*.

15.1.1 Euchaeta californica Esterly, 1906

Synonymy:

Pareuchaeta californica: Brodsky (1950)
Euchaeta dubia: Esterly (1906)
Pareuchaeta dubia: Brodsky (1950)
NOT P. californica: Tanaka and Omori (1968)
NOT P. dubia: Tanaka and Omori (1968)
NOT Euchaeta dubia: Vervoort (1963)

Morphology:

PLC rounded, Hd rounded or acute in dorsal view, but in lateral view with a small frontal eminence; Ro well developed; A1 just exceeds Pro length; PI expl with outer distal spine. P2 exp3 second outer spine arising from a lobe separated from the segment by a deep incision. Innermost seta of each CR naked and curving twice (1).

FEMALE TL 7.0-8.1 mm; Pro:Ur ratio about 3.5; Ro directed antero-ventrally; gns gt symmetrical in dorsal view, swollen laterally in proximal half; genital protuberance large, confined to proximal half of gns gt (1).

MALE TL 7.5 mm; Ro directed ventrally; P5 of complicated shape (1).

Size, the curved inner setae of the caudal rami, the symmetric gns gt (in ventral view) of the female and the rounded or slightly angular PLC separate this species from all other local members of the genus.

Distribution and Occurrence:

Reported only from the type locality (coast of California) and northeastern Pacific (1). Locally, in Queen Charlotte Strait (2). Rare in the study area and likely an indicator of water of southern origin.

Life History:

Juveniles undescribed; however, Campbell (3) describes all life history stages of the closely related species E. elongata. The characters used in the key should allow identification of the CV and possibly the CIV.

Comments:

This species has been misidentified on several occasions, in part due to the inadequate description of Esterly (4). Park (1) redescribes the species, indicates the synonymies, and considers that E. dubia represents the male of E. californica, which had previously been undescribed.

References:

1) Park, 1977
2) Stone, 1980
3) Campbell, 1934a
4) Esterly, 1906
Euchaeta californica

from Park, 1977
15.1.2  *Euchaeta elongata* Esterly, 1913

**Synonymy:**

*Euchaeta japonica*: Marukawa (1921); Campbell (1929b, 1934a); Mori (1937); Davis (1949b); Cameron (1957); Fulton (1972)

*Pareuchaeta japonica*: Brodsky (1950); Shih et al. (1971)

*P. elongata*: Tanaka (1958); Tanaka and Omori (1968); Evans (1973)

**Morphology:**

PLC produced slightly as blunt processes; A1 short, just exceed Pro length; innermost setae of each CR naked and curved twice (I).

**FEMALE**  TL 6.3-7.4 mm; gns gt large, narrow proximally but with a large genital protuberance arising from middle of segment; ans gt reduced; P5 lacking; PI exp two-segmented (I).

**MALE**  TL 5.5-6.3 mm; PLC somewhat reduced; mouth parts much reduced; PI exp three-segmented, expl lacking outer distal spine; P5 extremely large; rt bp2 enlarged, broadly rectangular; Ift enp reduced, rudimentary; rt enp long and styliform (I).

Separable from all other members of the genus by knob-like processes of the PLC in the CV and CVI.

**Distribution and Occurrence:**

Widely distributed and locally abundant in the North Pacific. Evans (2) discusses the distributional ecology in British Columbia and adjacent waters.

**Life History:**

The life history and post-embryonic development of this species are fully described (1). Bright blue egg clusters are often attached to the gns gt of adult females (convenient for bioassay and similar studies).

**Comments:**

The confusion in the taxonomy of the species is outlined by Evans (2). We accept the synonymy of *E. japonica* Marukawa with *P. elongata* Esterly which Evans also accepts.

**References:**

1) Campbell, 1934  
2) Evans, 1973
*Euchaeta elongata* from Marukawa, 1921; Mori, 1937; Campbell, 1934

---

263
15.1.3  *Euchaeta media* Giesbrecht, 1888

**Morphology:**

PLC rounded or angular; Hd acute in dorsal view, in lateral view with a distinct frontal eminence; innermost seta of each CR naked and straight; A1 just exceed length Pro; P2 exp3 median outer spine just reaches base of following spine (1).

**FEMALE** TL 3.30-4.64 mm; gnsgt asymmetrical in dorsal view, in ventral view with process on left lateral margin (1).

**MALE** TL 3.05-4.32 mm (1,2).

Separable from other local members of the genus by its relatively small size, the short median outer spine on the female P2 exp3, and the straightness of the setae on the inner edges of the caudal rami.

**Distribution and Occurrence:**

Common in the epibenthos of the tropical, subtropical and temperate zones of the world's oceans; Vervoort (2) summarizes the distribution. Locally, reported from Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed but should be similar in general form to those of *E. elongata* (4). The size and characteristic maxillipeds should allow the identification of the CV and possibly the CIV.

**Comments:**

Rare in the study area.

**References:**

1) Brodsky, 1950
2) Vervoort, 1963
3) Stone, 1980
4) Campbell, 1934a
Euchaeta media

from Esterly, 1905; Owre and Foyo, 1967; Grice, 1961; Park, 1966
15.1.4  **Euchaeta spinosa** Giesbrecht, 1892

**Synonymy:**

*Undeuchaeta major:* Esterly (1905; male only)

Vervoort (1963) gives extensive references, and Park (1978) gives an up-to-date summary of the distribution of the species.

**Morphology:**

Hd apically acute, Ro elongate; P2 exp3 median outer seta elongate, reaches base of distal outer spine; PI expl with outer distal spine; innermost seta of each CR naked and straight; P3-P4 posterior surfaces spinulose (1, 2).

**FEMALE**  TL 6.0-7.2 mm; ProtU: ratio about 2.6; gns gt ventral protuberance arising in proximal half of gns gt and flanked on either side by large plates; in ventral view, gns gt strongly asymmetric, with large outgrowth on the Ift side; in lateral view, genital flanges appear similar in shape; densely spinulose ventrally (1, 2).

**MALE**  TL 6.1-6.9 mm (1, 3).

*E. spinosa* is characterized by the shape of the genital prominence in the female and the spinulation of the P3-P4 posterior surfaces in both sexes.

**Distribution and Occurrence:**

Widely distributed in the tropical, temperate and subtropical regions of the Atlantic, Pacific and Indian Oceans (4). Locally, reported near the Gulf Islands (2) and in Queen Charlotte Strait (6).

**Life History:**

Juveniles undescribed but should be similar in general form to those of *E. elongata* (7). Most of the characters used to identify this species are restricted to the adult; however, the spine on PI expl may help to separate juveniles of this species from those of similar species. In *E. spinosa*, this spine barely reaches the mid-point of PI exp2.

**Comments:**

Rare in the study area, but may be more numerous in offshore areas that have been little studied until recently (e.g. oceanic water on the west coast of Vancouver Island).

**References:**

1) Brodsky, 1950

Euchaeta spinosa

from Esterly, 1905; Sars, 1925; Owre and Foyo, 1967
16.1 Onchocalanus Sars, 1905

Morphology:

Pro elongate, ovoid; Hd rounded, occasionally cristate; Ur short, ansgt reduced; Ro strongly developed, with a heavily chitinized basal portion, and a bifurcate apical part terminating in two points or two fine filaments; PLC triangularly produced, pointed or rounded, but without projections. Al as long or longer than Pro; A2 rami subequal; max2 with enlarged, uncinate setae, giving appearance of a distal, curved claw; seven brush-shaped sensory appendages and one long, filiform sensory organ also found distally on max2. Pl,2 segmentation: 3-1/3-2; caudal surfaces of swimming legs spinose; Pl expl with spine; P2-P4 exp3 terminal spines large, serrate (1, 2).

FEMALE P5 uniramous, three-segmented, with two apical spines; caudal surface of P5 covered with strong hairs (1).

MALE P5 uniramous; rt P5 short, three-segmented; lft P5 elongate, five-segmented (1, 2).

The short Ur, angular PLC, heavily chitinized Ro and modified max2 separate this genus from all others.

References:

1) Vervoort, 1957
2) Vervoort, 1950
16.1.1 **Onchocalanus magnus** (Wolfenden, 1906)

**Synonymy:**

Xanthocalanus magnus: Wolfenden (1906)
X. similis: Esterly (1906)?
Onchocalanus frigidus: Wolfenden (1911)
O. affinis: With (1915)

**Morphology:**

**FEMALE** TL 5.2-8.8mm; Hd rounded in dorsal view; PLC acutely angled but without processes in lateral view; Ro present as a notched plate bearing two thin filaments; A1 reach just past PLC; max2 modified, armed with a large, nonserrate falciform spine. Swimming legs spinulose on posterior surface; PI expl with outer distal spine, outer spines elongate; P5 uniramous, three-segmented and abundantly spinose (1).

**MALE** TL 5.2 mm; P5 uniramous, asymmetrical; Lt P5 five-segmented, 5P5 setose; rt P5 two-segmented, total length shorter than Lt IP5 (2).

**Distribution and Occurrence:**

Recorded primarily from Antarctic waters, but found also in the North Atlantic and northwestern Pacific Oceans and near the coast of California (1). The temperate specimens seem to be near the bottom end of the size range while the Antarctic specimens are near the upper end. Locally, extremely rare, but recorded in samples from the Institute of Ocean Sciences collection.

**Life History:**

Juveniles undescribed; however, the CV and possibly CIV should be separable based on size, the max2 and the PLC.

**Comments:**

Brodsky (1) suggests that Esterly's (3) Xanthocalanus similis was in fact a CV Onchocalanus magnus. Esterly's record is from California, and supports the idea of O. magnus being found in British Columbia waters; a reexamination of Esterly's type specimens is merited.

**References:**

1) Brodsky, 1950
2) Vervoort, 1957
3) Esterly, 1906
Onchocalanus magnus
from Vervoort, 1950, 1957; Brodsky, 1950
17.1  **Scottocalanus** Sars, 1905

**Morphology:**

Hd with triangular crest in lateral view; Ro massive, terminally bifurcate, with apices naked or bearing short processes; PLC usually produced backwards and acute; max2 bearing both vermiform and apically widened sensory setae. Pl-P4 posterior surfaces with numerous, irregularly set spines; Pl expl with outer distal spine.

**FEMALE** P5 uniramous, incompletely segmented, with two to four segments, armed on distal inner margin with large, serrate seta directed backward.

**MALE** P5 massive, biramous; enp short; lft P5 rami subequal and similar; rt P5 expl longer than enp; lft P5 bp longer than rt P5 bp. P5 of same general structure as Lophothrix and Scaphocalanus, but more massive (1).

**References:**

1)  Brodsky, 1950
17.1.1 *Scattocalanus persecans* (Giesbrecht, 1895)

**Synonymy:**

*Scalecithrix persecans*: Esterly (1905)

**Morphology:**

Pro robust; Hd cristate; PLC rounded and slightly produced posteriorly as broad flaps; Ro a strongly developed plate with a V-shaped incision reaching midlength of plate, the projection on either side of the incision armed with long, rostral filaments; Al approximately equals TL; angst reduced and may not be visible (1).

**FEMALE** TL 3.9-4.6 mm; Pros:Ur ratio about 5.0; gnsgt almost ½ Ur; P5 reduced, uniramous; distal segment of P5 armed with an elongate spiniform seta which reaches near end Ur (1).

**MALE** TL 4.3-5.4 mm; Pros:Ur ratio about 2.6; P5 biramous, rt enp one-segmented, styliform and slightly longer than expl; lft bp elongate, lft enp one segmented and styliform, reaching midpoint of exp2 (1).

**Distribution and Occurrence:**

The past confusion of this species makes interpretation of historical records difficult. Vervoort (1) gives records from the Indo-Pacific, Celebes Sea, Flores Sea and Makassar Strait, all between 14° and 129° E longitude. He is suspicious of Esterly's (2) records from California. Locally, Stone (3) records the species from Queen Charlotte Strait.

**Life History:**

Juveniles undescribed; however, the large size, crest and massive rostrum should allow identification of this species in the CIV and CV. Note, however, the possibility of confusion with *Lophothrix frontalis*.

**Comments:**

Vervoort (1) suggests that many records of *S. persecans*, including Brodsky's (4), are in fact *S. thori* With. Morris (5), however, indicates that while Brodsky's figures are based on Sars' (6) drawing of *S. thori* (as *S. persecans*), Brodsky is clearly referring to Esterly's (2) valid record of *S. persecans*. The taxonomy of this genus should be revised. Vervoort (1) gives a good account of some of the problems which need to be resolved.

Scottocalanus persecanus
from Sars, 1925; Vervoort, 1965
17.2 Lophothrix Giesbrecht, 1895

Morphology:

Hd often cristate; PLC rounded or angular; Ro large, distally bifurcate but without spines, PI expl without outer distal spine (1).

FEMALE P5 with three or four conspicuous distal setae, the largest of which is on the inner margin (1).

MALE P5 thin, biramous, enp short; lft P5 rami subequal and similar; rt P5 exp longer than enp; lft P5 bp longer than rt P5 bp; P5 of same general structure as Scottocalanus and Scaphocalanus (1).

1) Brodsky, 1950
17.2.1  **Lophothrix frontalis** Giesbrecht, 1895

**Synonymy:**

*Scolecithrix frontalis*: Esterly (1906)

**Morphology:**

PLC rounded, CR short.

**FEMALE** TL 4.75-7.4 mm; Pro:Ur ratio about 4.1; Hd cristate in dorsal view, Ro strongly bifurcate; gnspt as long as wide, narrows proximally; Ur segments with fringe of five teeth along distal margin; A1 approximately equal to TL; P5 three-segmented, armed apically with three spines (1).

**MALE** TL 4.5-6.0 mm; Pro:Ur ratio about 2.7; Hd without crest, but highly arched in front; Ro of two long spines; anspt much reduced; A1 extends to end Ur2; P5 biramous; rt P5 bp elongate; lft P5 bp2 widened; rami slender, styliform (1).

**Distribution and Occurrence:**

Widely distributed in the deep waters of all oceans. Vervoort (2) gives a detailed account of the distribution. Locally, reported in Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed; however, the characters used in the key should allow identification of the CV and possibly CIV.

**Comments:**

Rare in the study area, and may indicate intrusions of equatorial water (4).

**References:**

Loophothrix frontalis

from Sars, 1925
Scaphocalanus Sars, 1900

Morphology:

Ro with two thin, fairly long filaments; A2 rami subequal; max2 bearing
vermiform and band-shaped sensory setae. Pl expl lacking spine (I).

FEMALE

Hd usually cristate; P5 with one to three segments, bearing a
long inner spine and one to two apical spines (I).

MALE

Hd usually not cristate. P5 long, thin, biramous, enp short; lft
P5 rami subequal and similar; rt P5 exp longer than enp; lft P5
bp longer than rt P5 bp (I). P5 of same general structure as
Scotocalanus and Lophothrix.

Hd without crest:

Bradford (2) revises the family and redefines the genus. Copepods in this
family should be carefully examined, as confusion can arise among the
several closely related genera and species.

References:

1) Brodsky, 1950
2) Bradford, 1973
17.3.1 Scaphocalanus affinis (Sars, 1905)

Synonymy:

Amallophora affinis: Sars (1905)
A. gracilis: Wolfenden (1911)

Morphology:

PLC rounded or bluntly pointed; Al approximately equal length Pro; A2 enp 1.4 x exp; max2 bearing vermiform and band-shaped setae; Ro of two long filaments (1, 2).

FEMALE TL 5.0-5.4 mm for Pacific specimens (in the Atlantic 3.6 mm (2)); Hd with low crest; Pros:Ur ratio about 3.0; P5 uniramous, three-segmented, distal segment bearing four spines; two very short outer marginal spines, one longer apical spine, and a very long inner marginal spine (1, 2).

MALE TL 4.5 mm for Pacific specimens (in the Atlantic 3.5 mm (2)); Hd lacking crest; Pros:Ur ratio about 2.6; P5 reaches distal margin Ur3; rt enp long, reaching distal margin Ift bp2; Ift enp two-segmented and longer than exp (1).

The males of S. affinis and S. magnus are difficult to separate; S. affinis is slightly larger, and has a more broadly rounded head.

Distribution and Occurrence:

Widely distributed in the deep waters of the Atlantic, Indian and Pacific Oceans (2). Locally, rare but recorded from samples in the Institute of Ocean Sciences collection.

Life History:

Undescribed; however, the size, crestate head and round PLC may allow separation of the CV from all other taxa except S. magnus.

Comments:

The size difference between Atlantic and Pacific specimens is unusually large and should be further investigated. This family is complex, and must be examined with care to avoid confusion among the many closely related species and genera.

References:

1) Brodsky, 1950
2) Tanaka, 1961
Scaphocalanus affinis
from Sars, 1925; Tanaka, 1961
17.3.2 Scaphocalanus brevicornis (Sars, 1900)

**Synonymy:**

Scolecithrix brevicornis: Sars (1900)
S. minutus: Tanaka (1937)
Amallophora brevicornis: Sars (1901)
A. impar: Wolfenden (1911)

Tanaka (1) and Vervoort (2) agree that Brodsky’s (3) male S. brevicornis is actually S. elongatus. Tanaka (1) gives the first complete description of the male.

**Morphology:**

Hd and PLC rounded; Ro with an inflated base bearing two long filaments; Al approximately equal length Pro; A2 enp 1.3 x exp; max2 bearing modified sensory setae on terminal lobes; P2 expl outer marginal spine long and curved, reaching beyond midpoint of exp2 (1).

**FEMALE** TL 1.9-2.7 mm; Pro:Ur ratio about 3.2; gns gt slender, only slightly produced ventrally; P5 two-segmented, distal segment bearing one short outer marginal spine, one elongate apical spine, and one inner marginal spine about 1.5 x as long as the apical spine and denticulate along its distal margin (1).

**MALE** TL 2.2-3.0 mm; Pro:Ur ratio about 1.8; mid-dorsal suture on posterior 1/3 of cephalosome running parallel to the body axis; ans gt reduced; P5 reaches distal margin Ur2; lft P5 exp three-segmented, enp two-segmented; rt enp styliform (1).

Very similar to S. major, the only difference being a longer outer edge spine on the P2 expl.

**Distribution and Occurrence:**

Found deep in North Atlantic, Arctic, Antarctic and northwestern Pacific waters (1). Locally, reported as deep and rare in the Strait of Georgia (4).

**Life History:**

Juveniles undescribed; however, the characters used in the key should allow separation of the CV.

**References:**

1) Tanaka, 1961  
2) Vervoort, 1965  
3) Brodsky, 1950  
4) Fulton, 1972
Scaphocalanus brevicornis
from Koeller, 1974
17.3.3  *Scaphocalanus echinatus* Farran, 1905

**Morphology:**

PLC and Hd rounded; Ro with long, slender filaments; A2 exp 1.4 x enp; P2 expl with long, curved outer edge spine (1).

**FEMALE** TL 1.70-2.48 mm; Pro:Ur ratio about 3.8; P5 two-segmented; inner marginal spine 1.5 x as long as apical spine, and bearing about nine teeth along its distal margin (1).

**MALE** TL 1.26-1.34 mm; Pro:Ur ratio about 2.6; P5 extend to distal margin Ur4; rt exp three-segmented, distal segment reduced to a slender process; lft exp one-segmented (1).

**Distribution and Occurrence:**

Recorded from the Atlantic, southern Pacific, and Sea of Japan (1). Locally reported as deep and common in the Strait of Georgia (2).

**Life History:**

Juveniles undescribed; however, the CV and perhaps the CIV should be separable using the characters in the key.

**References:**

1) Tanaka, 1961
2) Fulton, 1972
Scaphocalanus echinatus

from Mori, 1937; Tanaka, 1961
17.3.4  *Scaphocalanus magnus* (T. Scott, 1894)

**Synonymy:**

- *Amallophora magna*:  T. Scott (1894); Sars (1903)
- *Scolecihtrix cristata*:  Giesbrecht (1895)
- *S. acrocephalus*:  Sars (1900)

**Morphology:**

PLC rounded or angular; Ro two slender filaments; A1 short; PI expl bearing outer distal spine; P2-P4 anterior surfaces spinulose (1).

**FEMALE**

- TL 4.02-5.20 mm; Pro:Ur ratio 3.3; Hd cristate; A2 enp 1.4 x exp; gnsgt slender, barely protruding ventrally; P5 two-segmented, outer marginal spine reaches apex of segment; inner marginal spine elongate and spinulose (1).

**MALE**

- TL 4.55-5.0 mm; Pro:Ur ratio about 2.0; Hd obtusely rounded, not cristate; A2 rami subequal; P5 extend to distal margin Ur2, basic shape as in other members of the genus (1).

Very similar to *S. affinis*, but differs by being slightly smaller in the female, having a less broadly rounded head and only two segments in the female P5.

**Distribution and Occurrence:**

Widely distributed in the deep waters of the Atlantic, Indian, Pacific and polar oceans (1). Locally, reported in Queen Charlotte Strait (2) and also in samples collected from the study area by the Institute of Ocean Sciences.

**Life History:**

Juveniles undescribed; however, the CV and possibly CIV should be separable, using the characters in the key, from all other taxa except *S. affinis* juveniles.

**References:**

1) Tanaka, 1961
2) Stone, 1980
Scaphocalanus magnus
from Brodsky, 1950; Tanaka, 1961
17.3.5 Scaphocalanus major (T. Scott, 1894)

Synonymy:

Scaphocalanus medius: Sars (1925); Brodsky (1950)
Scoleithrix major: T. Scott (1894)
S. gracilipes: Farran (1908)
Amallophora media: Sars (1907)
A. dubia var. similis: T. Scott (1894)

Morphology:

Hd and PLC rounded; P2 expl outer distal spine slightly shorter than \( \frac{1}{2} \) length exp2; P2-P4 rami spinulose on posterior surface (1).

FEMALE TL 2.4-3.1 mm; Pro:Ur ratio about 3.2; P5 two-segmented, outer marginal spine minute, apical spine elongate, inner marginal spine about 2 x apical spine (1).

MALE TL 2.4-2.8 mm; Pro:Ur ratio about 1.9; ansgt much reduced P5 reach distal margin Ur2, lft enp two-segmented and slightly enlarged proximally (1).

Distribution and Occurrence:

Widely distributed in the deep waters of the Atlantic, Indian and Pacific Oceans (1). Locally, recorded from samples taken in the study area by the Institute of Ocean Sciences, but quite rare.

Life History:

Juveniles undescribed; however, the CV and possibly CIV should be separable using the characters in the key.

References:

1) Tanaka, 1961
Scaphocalanus major
from Tanaka, 1961
17.3.6  **Scaphocalanus subbrevicornis** (Wolfenden, 1911)

**Synonymy:**

- *Scoleithrix glacialis*: Wolfenden (1911: male only)
- *Scaphocalanus gracilicaudatus*: Tanaka (1937: male only)
- *S. macropes*: Tanaka (1953)

**Morphology:**

PLC and Hd rounded, rostral filaments long, slender; P2 exp1 outer edge spine only about 1/3 length of outer margin of exp2; A2 rami subequal (1).

**FEMALE**  TL 1.75-2.10 mm; Pro:Ur ratio about 3.2; gnsgt as long as wide; ventral protuberance slight; P5 two-segmented; inner marginal spine 1.8 x apical spine; other spines small and variable in number (1).

**MALE**  TL 1.65-1.80 mm; Pro:Ur ratio about 2.1; P5 reach distal margin Ur3, similar in form to other members of the genus (1).

**Distribution and Occurrence:**

Widely distributed in deep waters of the Antarctic, Atlantic, Indian and Pacific Oceans (1). Locally, recorded from the Strait of Juan de Fuca (2).

**Life History:**

Juveniles undescribed; however, the CV and possibly CIV should be separable using the characters in the key.

**References:**

1) Tanaka, 1961
2) Chester et al., 1980
Scaphocalanus subbrevicornis

from Mori, 1937, Tanaka, 1961
**Racovitzanus** Giesbrecht, 1902

**Morphology:**

PLC rounded or angular; Ro large, single, sausage-shaped; PI expl without spine; max2 with band-shaped and vermiform sensory setae; A1 just exceeding prosome (1).

**FEMALE** Gnsgt elongate, almost ½ length of Ur; CR diverging laterally. P5 uniramous, symmetrical, two-segmented, with elongate spine on inner distal margin (1, 2).

**MALE** P5 biramous and asymmetrical (1).

This genus is intermediate between Scaphocalanus and Scolecithrix, but differs from both in the characteristic structure of the rostrum, which is large, single and somewhat sausage-shaped.

**References:**

1) Brodsky, 1950
2) Tanaka, 1961
17.4.1 *Racovitzanus antarcticus* Giesbrecht, 1902

**Morphology:**

Ro a large, rotund process with a short terminal appendage (1).

**FEMALE** TL 2.1-2.42 mm; PLC slightly acute in profile; Pro:Ur ratio about 3.0; gnsgt elongate, exceeds combined length of Ur2 and Ur3; A1 just exceed Pro length; max2 bearing band-shaped and verмiform sensory setae. P5 two-segmented, bearing short apical spine and much longer inner spine, the latter serrate and equal to length of distal P5 segment (1).

**MALE** TL 2.18 mm; P5 biramous, elongate and asymmetrical (3).

The distinctive rostrum plus the presence of both band-shaped and verмiform sensory setae on the max2 differentiates *R. antarcticus* from other local species.

**Distribution and Occurrence:**

Found in the northern Pacific Ocean, Bering Sea, Sea of Okhotsk, and southern Indian and Pacific Oceans (1). Locally, deep and rare, but encountered in the Strait of Georgia (2) and occasionally present in protected waters to the north.

**Life History:**

Juveniles undescribed; however, at least the CV and CIV females should be separable on the basis of their rostrum.

**Comments:**

The genus *Racovitzanus* is poorly defined and contains only one verified species, although others have been assigned to it. The genus is in need of revision.

**References:**

1) Brodsky, 1950  
2) Fulton, 1972  
3) Vervoort, 1957
Racovitzanus antarcticus

from Brodsky, 1950; Vervoort, 1957
17.5  **Scolecithricella** Sars, 1903

**Synonymy:**

**Amallothrix** Sars, 1925

**Morphology:**

Hd and PLC rounded; Pro short, wide; Pl expl with or without spine. Ro bifurcate; Al usually longer than Pro, sometimes short; A2 exp longer than A2 enp; max2 usually with veriform sensory setae, and occasionally with some bud-like setae. Pl,2 segmentation: 3-1/3-2 (1, 2, 3).

**FEMALE** P5 uniramous, with one distinct spine and occasionally one or two smaller spines (1, 2, 3).

**MALE** P5 biramous, with enp reduced, and as long as or longer than Ur (1, 2, 3).

**Comments:**

All members of the genus *Scolecithricella* are similar and the key must be followed very carefully to assure proper identification. This genus should be revised. It should likely be split into more than one genus, but the variability of the characters make such a division difficult without access to extensive reference collections of type specimens.

**References:**

1) Brodsky, 1950
2) Tanaka, 1962
3) Mori, 1937
17.5.1  *Scolecithricella emarginata* (Farran, 1905)

**Synonymy:**

*Scolecithricella obtusifrons:* Sars (1909)?; A. Scott (1909); Bigelow (1926)

*Scolecithrix emarginata:* Farran (1926)

*S. obtusifrons:* Farran (1908); van Breemen (1908)?; A Scott (1909)

*S. aequalis:* Wolfenden (1911)

*S. atlantica:* Wolfenden (1904); van Breemen (1908)

*S. inornata:* Esterly (1906)

*Amlallothrix emarginata:* Sars (1925); Rose (1933); Bradford (1973)

*A. inornata:* Brodsky (1950)

*Amlallophora obtusifrons:* Pearson (1906)

*Scaphocalanus obtusifrons:* With (1915)

**Morphology:**

Hd and PLC rounded; A1 exceed TL; A2 exp 1.2 x enp; Ro a small basal plate bearing two robust filaments; ansgt reduced and difficult to see; Plexpl with spine (l).

**FEMALE** TL 3.65-4.73 mm; Pros:Ur ratio about 4.7; P5 two-segmented, elongate and rectangular; distal segment bearing two spines near the apex (this character variable) (1).

**MALE** TL 3.60-4.00 mm; Pros:Ur ratio about 2.7; P5 slender, lft bpl,2 much elongate, bearing two subequal rami, rt P5 reduced, shorter than lft (1, 2).

**Distribution and Occurrence:**

The diverse synonymies confuse distributional records; however, the species appears to be fairly common in the deep waters of the North Atlantic and is also recorded from the Indo-Pacific, Arabian Sea, Sea of Japan, north-eastern Pacific and Pacific coast of North America (3). Locally, it has been recorded as *Amlallothrix inornata* (4).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

Bradford (5) revises the family *Scolecithricidae* and redefines some of the genera. She places this species in the genus *Amlallothrix* Sars, 1925. Although the status of these genera is still to be resolved, we follow Tanaka (1) and Vervoort (3) in placing this species in the genus *Scolecithricella.*

**References:**

1) Tanaka, 1962  
2) Brodsky, 1950  
3) Vervoort, 1965

5) Bradford, 1973
Scolecitricella emarginata
from Park, 1980; Tanaka, 1962
17.5.2  *Scoleciethricella minor* (Brady, 1883)

**Synonymy:**

*Scoleciethrix minor*: Cameron (1957)
*S. roemeri*: Mrazek (1902)

**Morphology:**

Hd and PLC rounded; Hd apex very convex in lateral view; Al less than TL; Ro in form of bifurcate plate with acute rami but bearing no filaments; P1 expl lacking spine (1).

**FEMALE** TL 1.25-1.40 mm; Ur narrow; Pros:Ur ratio about 4.0; P5 one-segmented, broad, only slightly narrowed proximally, bearing short apical spine and elongate inner marginal spine (1).

**MALE** TL 1.20-1.40 mm; P5 exceed length Ur; lft P5 enp reduced, elongate; lft exp3 long and acute; rt enp rudimentary (1).

**Distribution and Occurrence:**

Widely distributed in all of the world's oceans (2). Locally, common in the Strait of Georgia and found throughout the study area (3).

**Life History:**

Juveniles undescribed. The presence of only two outer edge spines on the P1exp might allow juveniles of *S. minor* to be separated from other members of the genus.

**Comments:**

Brodsky (1) separates this species into two varieties, one of which, *S. minor* var. *orientalis*, occurs in the northern Pacific, Sea of Japan, Sea of Okhotsk and Bering Sea. The local species conforms to this variety.

**References:**

1) Brodsky, 1950  
2) Vervoort, 1965  
3) Fulton, 1972
Scoleciithricella minor
from Park, 1980
17.5.3 *Scolecithricella subdentata* (Esterly, 1905)

**Morphology:**

**FEMALE** TL 1.4-2.2 mm; Al shorter than Pro; max2 bearing vermiform setae; PI expl with outer distal spine; P5 one-segmented, narrowing gradually towards base; apical spine reduced, inner marginal seta situated closer to distal end (1).

**MALE** Undescribed.

Similar to other members of the genus, but with relatively short Al and with fP5 only slightly narrowed proximally. As with all other members of this complex family, *S. subdentata* must be identified with care.

**Distribution and Occurrence:**

Recorded from the coast of California (2). Locally, reported as rare in the Strait of Georgia (3).

**Life History:**

Juveniles undescribed, key valid for adults only.

**References:**

1) Brodsky, 1950
2) Esterly, 1905
3) Fulton, 1972
Scolecitricella subdentata

from Esterly, 1905
17.5.4 *Scolecithricella ovata* (Farran, 1905)

**Morphology:**

Hd and PLC rounded; Ro a divergent base bearing strong spines; CR short; Al just less than TL; A2 exp 1.4-1.5 x enp; max2 bearing modified sensory setae (1).

**FEMALE** TL 1.80-2.20 mm; Pro:Ur ratio about 4.6; gnsgt as long as wide; P5 two-segmented, distal segment strongly narrowed towards base, bearing short inner marginal seta and occasionally a minute apical seta (1).

**MALE** TL 1.59 mm; Pro:Ur ratio about 2.5; ansgt reduced; P5 reaches ansgt; rt P5 four-segmented and very short, lft P5 five-segmented and much longer (1).

Separable from other members of the genus by the short rt mP5 and the proximally narrowed fP5. The similarity among members of this family requires that extra care be taken in their identification.

**Distribution and Occurrence:**

North Pacific, North and South Atlantic Oceans and Antarctic waters (1, 2). Locally, recorded in Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed, key valid for adults only.

**References:**

1) Brodsky, 1950
2) Tanaka, 1962
3) Stone, 1980
Scolecithricella ovata
from Brodsky, 1950; Park, 1968
**Morphology:**

Pro short, broad; PLC rounded; Ur and CR short; Ro with rounded, knob-like basal portion bearing two long filaments; A2 exp much longer than A2 enp; mxp2 swollen, greatest thickness at midlength. PI expl bearing elongate spine at outer distal corner; P1-P4 usually without surface spinules; P2-P4 terminal spines serrate (1, 2).

**FEMALE** P5 uniramous (1, 2).

**MALE** P5 biramous (1, 2).

**References:**

1) Fleminger, 1957
2) Park, 1967b
Morphology:

Robust body; rounded PLC which are extended posteriorly; rounded head profile; short Al (1).

**FEMALE**  TL 1.25-1.31 mm; P5 with exceptionally large distal spines (1).

**MALE**  TL 1.09-1.12 mm; Ift 3P5 with both a falciform and a small triangular process (1).

Distribution and Occurrence:

Reported from the type location, the Strait of Georgia, where it is uncommon and deep (2) and from Strait of Juan de Fuca (3).

Life History:

Juveniles undescribed; key valid for adults only.

Comments:

_Tharybis fultoni_ is the only local member of the genus.

2)  Fulton, 1972
3)  Frost, pers. comm.
Tharybis fultoni
from Park, 1967
19.1 **Eurytemora** Giesbrecht, 1898

**Morphology:**

Hd rounded, Ro with two small filaments; thorax five-segmented; Ur and CR elongate. P1-P4 segmentation: 3-1/3-2/3-2/3-2 (1).

**FEMALE** PLC with large, pterygoid processes; Ur three-segmented; A1 symmetrical. P5 uniramous, usually symmetrical, four-segmented. 3P5 bearing large inner process on distal margin (1).

**MALE** PLC rounded; Ur four- or five-segmented. A1 asymmetrical, rt A1 geniculate. P5 uniramous, asymmetrical; lft P5 four-segmented, rt P5 four or five-segmented with long, curved distal segment (1).

Separated from all other local genera by the elongate Ur and, in the females, by the pterygoid processes and, in the males, by the geniculate A1 and distinctive P5.

**References:**

1) Brodsky, 1950
19.1.1 *Eurytemora affinis* (Poppe, 1880)

**Synonymy:**

*Eurytemora hirundoides*: Nordquist (1888); Campbell (1929b); Davis (1943); Brodsky (1950); Cameron (1957); Legare (1957); Fulton (1968, 1972).

**Morphology:**

**FEMALE** TL 1.48-1.71 mm; PLC armed with large pterygoid processes; gnskt sharply narrowed distally; ansgt longer than gnskt; ansgt and CR spinulose; 4P5 apical spine smooth, much longer than outer distal spine of same segment; 3P5 with inner distal corner extended onto an acute process (1).

**MALE** TL 1.40-1.65 mm; PLC rounded; P5 uniramous, four-segmented; rt mP5 distal segment swollen proximally; lft mP5 widened apically, with two processes separated by a depression (1).

Separable from the other members of the genus in the male by the extreme apical widening of the lft 4P5; the female is separable based on the spinulose ansgt and CR, and the lack of denticulations on the inner process of the 3P5.

**Distribution and Occurrence:**

Baltic Sea, northeastern and northwestern Atlantic, and northeastern Pacific (1). Locally, reported as common in the Strait of Georgia (2) and near the Queen Charlotte Islands (3).

**Life History:**

All stages, including nauplii, have been well-described (4); however, the lack of comparable complete descriptions for the other two local members of the genus restricts the applicability of the key to the adult only.

**Total Length (mm):**

4) Davis, 1943
Eurytemora affinis
from Sars, 1903
19.1.2 Eurytemora americana Williams, 1906

Synonymy:

- Eurytemora thompsoni: Willey (1923); Brodsky (1950)
- E. transversalis: Campbell (1930); Brodsky (1950)
- E. kieferi: Brodsky (1950)

Morphology:

Elongate Ur and CR (1).

**FEMALE** TL 1.20-1.58 mm; Posterior thoracic segment shortened, with pterygoid processes. CR spinulose. 3P5 expl with smooth inner process, distal segment with subequal apical spines (1).

**MALE** TL 1.22-1.43 mm; CR not spinulose, PLC without projections. P5 uniramous, rt 2P5 with swelling on inner edge, rt 3P5 long and slender, 4P5 falcate, inner margin irregular, with small spines. Lft 2P5 with proximal swelling, distal segment slightly dilated, bearing distally a bulbous expansion armed with two small spines (1).

Similar to the other local members of the genus, E. affinis and E. pacifica, but female with spinulose CR, smooth 3P5 inner process and terminal apical spines subequal in the P5. Male distinguished by proximal swelling of lft 2P5, and shape of distal segment of lft P5.

Distribution and Occurrence:

In the Atlantic, from Narragansett Bay to Ungava Bay, the northern Icelandic coast and southern British coast. In the Pacific, along the eastern edge from San Juan Island northward to Point Barrow, in the western Bering Sea and Sea of Okhotsk (1).

Life History:

All nauplii and copepodite stages have been briefly described and illustrated from laboratory reared specimens (2). CV males have a four-segmented Ur as opposed to the three-segmented Ur of the CV females.

References:

1) Heron, 1963
2) Grice, 1971
Eurytemora americana from Heron, 1963
Eurytemora pacifica Sato, 1913

**Synonymy:**

*Eurytemora johanseni*: Willey (1920); Davis (1949b); Brodsky (1950); Legare (1957)

**Morphology:**

Both males and females exhibit some degree of asymmetry (1).

**FEMALE**

TL 0.99-1.30; PLC with pterygoid processes; Ur with three segments of approximately equal length; gnsgt greatly expanded laterally; CR long, but shorter than in other members of the genus, and naked; gnsgt and Ur2 each armed with two short bristles on each side. P5 asymmetrical uniramous, four-segmented; 3P5 bearing two outer spines and an acute denticulated process arising from the inner distal corner; 4P5 with long apical spine and single lateral spine. Asymmetry: apical spine of left leg much larger than that of right (1).

**MALE**

TL 1.03-1.12 mm; PLC rounded; Ur five-segmented; P5 asymmetrical, uniramous, four-segmented; Lft P5 distal segment club-shaped, 2P5 greatly widened medially; rt P5 distal segment narrow and curving (1).

Separable from other local members of the genus in the female by the lack of spinulation on the gnsgt and CR, and the denticulation of the inner process of P5 expl. The male is separable by the club-like shape of the Lft P5.

**Distribution and Occurrence:**

Reported from the Sea of Japan, northern Alaskan coast, Bering Sea and Sea of Okhotsk (1). Locally, reported from the Strait of Georgia (2).

**Life History:**

Juveniles undescribed but those of *Eurytemora affinis* have been described and figured in detail (3).

**References:**

1) Brodsky, 1950  
2) Legare, 1957  
3) Davis, 1943
Eurytemora pacifica
from Brodsky, 1948

319
20.1 Metridia Boeck, 1864

**Morphology:**

Hd rounded; PLC rounded, occasionally with small, blunt papilla; Ur elongate; CR thin, sometimes long; terminal Ur segment with elongated posterior corners; A1 short. P2 enp1 greatly narrowed proximally, with pair of hooks arising distal to the constriction and directed towards the base of the leg (I).

**FEMALE** P5 uniramous, three to four-segmented, distal segment with three, or sometimes two, long setae (I).

**MALE** rt P5 distal segment slightly widened, third segment with long, curved process on inner margin (I).

The long Ur, rounded head, relatively short A1 and P2 enp1 hooks separate this genus from other local genera.

**References:**

1) Brodsky, 1950
20.1.1  *Metridia curticauda* Giesbrecht, 1889

**Morphology:**

Hd strongly tapered apically in profile; Ur elongate, approximately 0.6 x length Pro; PLC rounded; A1 longer than Pro, but do not reach past ansgt; P5 uniramous; P2 enpl with hooks (1, 2).

**FEMALE**  TL 2.5-3.6 mm; P5 three-segmented; apical segment reduced, bearing three subequal setae (1, 2).

**MALE**  TL 2.0-3.1 mm; P5 four-segmented; Ift 2P5 with strongly curved process directed inward (1, 2).

Separable from other local members of the genus by size, the moderate length of the A1, and in the female the approximately subequal apical setae on the P5.

**Distribution and Occurrence:**

Atlantic Ocean, Bay of Bengal, Antarctic waters; Pacific Ocean from 35°N latitude to 3°S latitude; northwestern Pacific Ocean, Bering Sea, Malay Archipelago (1, 2). Locally, recorded from the Strait of Juan de Fuca (3).

**Life History:**

Juveniles undescribed, however the female CV should be distinguishable based on the length of the A1 and the apical setae on the P5.

**References:**

1) Brodsky, 1950
2) Tanaka, 1963
3) Chester et al., 1980
**Metridia curticauda**

*from Brodsky, 1950; Tanaka, 1983*
20.1.2  *Metridia lucens* s.l. Boeck, 1864

**Synonymy:**

*Metridia hibernica:* Giesbrecht (1892)

**Morphology:**

Ur elongate; Pro:Ur ratio about 1.8; Hd profile flattened anteriorly; Al short; Pro widest in anterior third of its length; P2 enpl with hooks (1).

**FEMALE** TL 2.5–2.9 mm; P5 widely variable, but with three terminal setae usually varying in length, innermost longest (1).

**MALE** TL 2.0–2.3 mm; P5 uniramous, rt 2P5 with curved, elongate inner process (1).

Separable from almost all other local members of the genus by its relatively small size and short Al; however, can only be separated from *M. lucens* s.l. on the basis of complicated body measurements (2). *M. lucens* adult females from Indian Arm, British Columbia, have a shorter Pro (1.79 mm vs 2.08 mm for *M. pacifica*), and adult males have a wider ansgt (0.14 mm vs 0.12 mm for *M. pacifica*). The ranges of these measurements overlap, but their 95% confidence intervals do not.

**Distribution and Occurrence:**

The Atlantic form has been reported from the Barents, Norwegian and North Seas, North and temperate Atlantic, English Channel and Mediterranean Sea (1). The distribution of the Pacific form cannot be readily separated from the distribution of *M. pacifica*; however, *M. lucens* s.l. appears to be the the form found in Indian Arm (2).

**Life History:**

Juveniles undescribed; however, the elongate Ur and short Al should allow identification of the CV and CIV and its separation from all similar species except for *M. pacifica*.

**Comments:**

*M. lucens* s.l. and *M. pacifica* cannot be readily separated although they appear to be statistically distinct on the basis of body segment measurements (2). The *Metridia* species found in Indian Arm conforms to the general description of *M. lucens* from the Atlantic; however, comparison of specimens from both locations indicates statistical differences in various body measurements (2). Here, we consider the Indian Arm form to be *M. lucens* s.l. The latter species should be further studied and assigned an appropriate name. Further studies are also required to allow better separation of *M. lucens* s.l. from *M. pacifica*, so that the distributions of these two species can be clearly defined.

1) Brodsky, 1950  
2) Thorp, 1980
Metridia lucens
from Thorp, 1972

325
20.1.3 Metridia okhotensis Brodsky, 1950

Synonomy:

Metrida longa: Campbell (1929b); Davis (1949b); Cameron (1957)

Morphology:

FEMALE TL 4.5-4.8 mm; A1 shorter than Pro; PLC rounded; Pro:Ur ratio approximately 1.7. P5 with elongate inner lateral seta and two subequal terminal setae (1, 2).

MALE Undescribed.

Separable from other members of the genus by size, the configuration of setae on the P5, the length of the A1 and the relative length of the Ur.

Distribution and Occurrence:

Reported from the Sea of Okhotsk and northeastern Pacific (3). Deep and common in the Strait of Georgia (4, 5); reported also from the vicinity of the Queen Charlotte Islands (6).

Life History:

Juveniles undescribed, key valid for adults only.

Comments:

One of the larger copepods in the study area, occasionally abundant and may be an important food source to planktivores.

References:

1) Brodsky, 1950
2) Tanaka, 1963
3) Davis, 1949b
4) Campbell, 1929b
5) Fulton, 1972
6) Cameron, 1957
Metridia okhotensis
from Brodsky, 1950; Tanaka, 1963
20.1.4 *Metridia pacifica* Brodsky, 1950

**Synonymy:**

*Metridia lucens: Campbell (1929b); Davis (1949b); Cameron (1957); Legare (1957)*

**Morphology:**

Ur elongate; Pro:Ur ratio about 1.8; Hd profile flattened anteriorly; Al short; Pro widest in anterior third of its length (1).

**FEMALE** TL 2.6-3.1 mm; P5 widely variable, but usually with three subequal terminal setae (1).

**MALE** TL 2.0-2.1 mm; P5 uniramous, rt 2P5 with curved, elongate inner process (1).

Separable from almost all other members of the genus by its relatively small size and short Al; however, can only be separated reliably from *M. lucens* s.l. on the basis of complicated body measurements (2). *M. pacifica* adult females have a longer Pro (2.08 mm vs 1.79 mm for *M. lucens* s.l.) and adult males of *M. pacifica* have a narrower an nxt (0.12 mm vs 0.14 mm for *M. lucens* s.l.). There is some overlap in the ranges of these measurements, but not in their 95% confidence limits.

**Distribution and Occurrence:**

Reported from the North Pacific, Sea of Japan, Bering Sea, southern Chukchi and Okhotsk Seas (1). Locally, abundant and reported throughout the study area (3, 4, 5). The presence of the very similar *M. lucens* s.l. in the study area and perhaps elsewhere in the North Pacific suggests that some records of *M. pacifica* may refer to either or both species (2).

**Life History:**

Undescribed; however, the elongate Ur and short Al should allow identification of the CV and CIV and its separation from all similar species except for *M. lucens*. Lengths have been reported for the copepodite stages (5).

5) Fulton, 1972
Metridia pacifica

from Thorp, 1972
20.1.5  Metridia princeps  Giesbrecht, 1889

Morphology:

Ur elongate; Pro:Ur ratio 1.3; Ro a bifurcate plate bearing two moderately long hairy filaments; PLC rounded; A1 at least as long as TL (1, 2).

FEMALE  TL 7.1-8.5 mm; P5 uniramous, with four segments (including the base of the leg), 2P5 bearing bundle of long setae at outer distal corner. 3P5 with three subequal apical setae (1, 2).

MALE  TL 6.8-8.2 mm; A1 geniculate; ansgt wide with projecting corners; CR twice length of ansgt and much longer than wide. Rt P5 uniramous, four-segmented, rt 2P5 bearing long, slender inner process, rt 3P5 bearing a parallel plate separate from the segment; Lft P5 uniramous, shorter than right, Lft 2P5 and 3P5 fused (1, 2).

Readily identified by the size, the elongate Ur and the long A1.

Distribution and Occurrence:

A widely distributed, deep-water species occurring in all great oceans including the Arctic and Antarctic regions (2). Locally, reported from Queen Charlotte Strait (3).

Life History:

TL are reported for the CV male (5.7 mm) and female (5.8-6.3 mm) (2). CV should be separable based on size, elongate Ur and relatively long A1.

Comments:

A deep-water species which, if found in shallow continental shelf areas, may indicate intruding deep oceanic water.

References:

1) Brodsky, 1950  
2) Vervoort, 1965  
3) Stone, 1980
Metridia princeps

from Sars, 1925
20.2  Pleuromamma Giesbrecht, 1898

Morphology:

Black pigment spot located on either rt or lft side of Th1; A1 often armed proximally with large outer denticles, Ur shorter than in Metridia and often asymmetrical; Hd with short, acute apical process; Ro prominents and massive, with two hairy filaments. P2 enpl asymmetrical and either one (or more commonly) both uncinate; P3 expl outer distal spine with elongate base demarcated by deep notch (1, 2, 3).

FEMALE  Ur three-segmented; P5 uniramous, two- to four-segmented, fourth segment usually small; distal segment with several long setae or spines; inner margin of two segments usually setose (1, 2, 3).

MALE  P5 uniramous, asymmetrical; rt P5 distal segment strongly curved, preceding segment with long, curved inner process (1, 2, 3).

The pigment spot, Hd process and Ro shape separates this genus from all others. Large outer denticles located on the proximal portion of A1 are also found in Gaussia.

2) Farran, 1948g  (Fiches, Sheet 17)
3) Mori, 1937
20.2.1  **Pleuromamma abdominalis** (Lubbock, 1856)

**Synonymy:**

*Pleuromma abdominale*: Claus (1863)

**Morphology:**

Pigment spot usually on the left side; head apex angular, but without process in dorsal view; Al denticulate (1).

**FEMALE**  TL 2.4-4.4 mm; Al with two large denticles proximally; Ur symmetrical. P5 four-segmented, distal segment bearing three unequal apical setae and two thin spines, inner margins of 3P5, 4P5 setose (1).

**MALE**  TL 2.7-4.3 mm; rt Al geniculate, proximal segments denticulate. Ur extremely asymmetrical, with long, thick bundles of setae. Lft P5 distal segment very broad (1).

This species is very similar to the large *P. xiphias*. Both female and male can be differentiated by the lack of an acute apical process on the Hd. In the female, the denticle on the second proximal segment is smaller and directed forward, and in the male the asymmetrical projections on the Ur are more pronounced than in *P. xiphias*.

**Distribution and Occurrence:**

Surface dwelling in the tropical Atlantic, Pacific and Indian Oceans, with one variety found near the coast of California and in the southern Sea of Okhotsk (1). Locally, reported from Queen Charlotte Strait (2).

**Life History:**

Juveniles undescribed, key valid for adults only.

**Comments:**

Some authors subdivide this species into three varieties (3); however, here we consider the species in its broadest sense.

**References:**

1)  Brodsky, 1950  
2)  Stone, 1980  
3)  Vervoort, 1965
Pleuromamma abdominalis

from Mori, 1937; Owre and Foyo, 1967
20.2.2  *Pleuromamma borealis* (Dahl, 1893)

**Synonymy:**

*Pleuromamma gracilis*: Esterly (1905, 1912)
NOT *P. gracilis*: Brodsky (1950, 1962)

**Morphology:**

Pigment spot on rt side; P5 uniramous (1).

**FEMALE** TL 1.67-2.46 mm; P5 with three segments, three unequal apical spines, the outer being longest, inner margins not setose (1).

**MALE** TL 1.47-2.13 mm; rt P2 enpl uncinate, lft 3P5 with a short, blunt projection (1).

Separable from the other local species in the genus by the small size, the lack of denticles on the A1, and in the female the presence of three segments in the P5.

**Distribution and Occurrence:**

Widely distributed over tropical, subtropical and temperate parts of the Atlantic and Indian Oceans (e.g. between 60°N and 55°S in the Atlantic), more southerly in the Pacific, but reported from the coast of California and the central tropical Pacific (2). Locally, reported from Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed; however the small size should allow differentiation of the CIV and CV.

**Comments:**

Except for the structure of the adult P5, *P. borealis* is very similar to *P. gracilis*, which has not been reported from the study area, but elsewhere has a similar distribution (2).

**References:**

1) Brodsky, 1950
2) Vervoort, 1965
3) Stone, 1980
Pleuromamma borealis

from Rose, 1933; Grice, 1961
Pleuromamma quadrungulata (Dahl, 1893)

**Morphology:**

Pigment spot on rt side (1).

**FEMALE** TL 3.3-5.0 mm; A1 bearing long, incurvate denticles on proximal segments as follows: 1A1 with two denticles, 2A1 and 4A1 each with one denticle. P5 uniramous with four segments, 4P5 with three unequal apical setae, inner setae longest (1).

**MALE** TL 3.1-4.5 mm; A1 geniculate, also with denticles; Ur symmetrical; P2 enpl uncinate on both sides (1).

Female separable from other members of the genus on the basis of the number of denticles on the A1 (4), and the orientation of these denticles (all are directed medially). Male separable based on the symmetry of the Ur.

**Distribution and Occurrence:**

Widely distributed in waters of intermediate and great depths in the tropical and subtropical Atlantic, Indian and Pacific Oceans (2). Locally, deep and rare in the Strait of Georgia (3), Queen Charlotte Strait (4) and the Strait of Juan de Fuca (5).

**Life History:**

Juveniles undescribed; however, the character of the A1 denticles should allow the identification of the CV.

**Comments:**

This species is sometimes considered to have two varieties (2), but here we consider the species in its broadest sense. In newly caught specimens, minute red spots may be visible on the ventral surface and leg basipodites (1).

**References:**

1) Brodsky, 1950
2) Vervoort, 1965
3) Fulton, 1972
4) Stone, 1980
5) Chester et al., 1980
Pleuromamma quadrungulata

from Brodsky, 1950; Grice, 1961; Owre and Foyo, 1967
20.2.4 Pleuromamma robusta (Dahl, 1893)

Morphology:

AI without denticles (1, 2).

**FEMALE** TL 2.7-4.5 mm; P5 uniramous, four segments, terminal segment with three apical spines, the inner being longest (1, 2).

**MALE** TL 3.0-3.4 mm; Ur symmetrical (1, 2).

Separable from other local members of the genus by size, the lack of denticles on the AI and in the male the symmetry of the Ur.

Distribution and Occurrence:

Reported from the North Atlantic and Indian Oceans (1). Locally, reported from the Strait of Juan de Fuca (3).

Life History:

Juveniles undescribed; however the lack of AI denticles and the size should allow separation of the CV.

References:

1) Farran, 1948g (Fiches, Sheet 17)
2) Mori, 1937
3) Chester et al., 1980
Pleuromamma robusta

from Sars, 1903
Pleuromama scutullata Brodsky, 1950

Morphology:

Pigment spot on rt side; Pro:Ur ratio approximately 0.44; A1 reach midpoint of Ur; proximal segments of A1 denticulate (1).

FEMALE TL 3.6-4.0 mm; Pro with border between Hd and Th1 marked laterally by a ridge visible in dorsal view. P5 with four segments, distal segment with three long apical setae, inner seta as long as the leg (1).

MALE TL 3.1-3.2 mm; Ur symmetrical; Lft A1 geniculate; rt P5 distal joint strongly widened; preceding joints with acute inner process, almost chela-like in appearance, but not articulating (1).

Separable from other local members of the genus by the number of denticles on the A1 (more than two), the tendency for the denticles to be oriented in different directions, and the symmetry of the mUr.

Distribution and Occurrence:

A deep-water species reported from the northwestern Pacific, Bering Sea and southern Sea of Okhotsk (1). Locally, reported from Queen Charlotte Strait (2).

Life History:

Juveniles undescribed; however, the number and orientation of the denticles should allow identification of the CV.

References:

1) Brodsky, 1950
2) Stone, 1980
Pleuromamma scutullata

from Brodey, 1950
Pleuromamma xiphias (Giesbrecht, 1889)

Morphology:

Hd apex with an acute process which arises near the base of the Ro and is bent slightly downward, visible in dorsal and lateral views (1).

FEMALE TL 3.5-5.9 mm; Ur symmetrical; P5 four-segmented, distal segment bearing three apical setae, inner margins of 3P5, 4P5 setose (1).

MALE TL 4.0-6.4 mm; rt A1 geniculate; proximal segments denticulate, Ur asymmetrical, with long, thick bundles of setae (1).

This species is very similar to the smaller P. abdominalis. Both female and male can be identified by the acute apical process on the Hd. In the female the large denticle on the second proximal segment of the A1 is directed medially, and in the male the asymmetrical projections on the Ur are more pronounced in P. abdominalis.

Distribution and Occurrence:

Found generally between 200 and 1000 m in tropical and subtropical zones of the Atlantic, Indian and Pacific Oceans, reaching northward along the eastern margin of the North Pacific (1). Locally, reported from Queen Charlotte Strait (2).

Life History:

Juveniles undescribed; however, the Hd process should allow separation of the CIV and CV.

Comments:

Rare in the study site, and may indicate intrusions of equatorial water (3).

References:

1) Brodsky, 1950
2) Stone, 1980
3) Gardner, 1982a
Pleuromamma xiphias
from Esterly, 1905; Mori, 1937
20.3 **Gaussia** Wolfenden, 1905

**Morphology:**

Proximal portion of A1 with denticles; no pigment spot on Th1; PLC produced into long spikes; ansgt with wing-like processes directed backward and partially concealing the short CR. P2 enpl with two inner hooks (1).

**FEMALE** Ur three-segmented; gnsgt usually symmetrical and always greatly inflated. P5 uniramous, four or five segments, distal segments setose (1).

**MALE** Ur five-segmented; P5 uniramous, three-segmented, rt P5 without long, curved inner process (1).

Large outer denticles located on the proximal portion of A1 are also found in *Pleuromamma*. *Gaussia* can be separated from other local genera by the distinctive angst.

**References:**

1) Brodsky, 1950
20.3.1 **Gaussia princeps** (T. Scott, 1894)

**Synonymy:**

*Metridia scotti*: Giesbrecht (1897)
*Gaussia scotti*: Wolfenden (1905, 1908, 1911)
*G. melanotica*: Wofenden (1905)
*Metridia atra*: Esterly (1906, 1912)

**Morphology:**

Hd with short, rounded apical process; Ro with two long, hairy filaments; PLC elongated as spikes; ansgt with blunt, conical processes laterally which obscure the origin of the outer lateral setae of the CR; Al at least as long as TL (1, 2).

**FEMALE** TL 9.0-12.0 mm; gnsgt inflated, asymmetrical (1, 2).

**MALE** TL 8.0-12.0 mm; PLC spikes shorter and blunter than female. Al geniculate (1, 2).

The only species of the genus found in the study area. Identifiable by its size, the shape of the PLC, f gnsgt, the Ro and the other characters noted above and in the description of the genus.

**Distribution and Occurrence:**

A characteristic bathypelagic species which is widely distributed over large deep-water areas of the Atlantic, Indian and Pacific Oceans (2). Locally, recorded from Queen Charlotte Strait (3) and off Cape Flattery (4).

**Life History:**

Juveniles undescribed, but sizes have been reported for some juvenile stages (2).

**Total Length (mm):**

21.1.1 Centropages abdominalis Sato, 1913

Synonymy:

Centropages mcmurrichi: Willey (1920); Campbell (1929b); Davis (1949a); Brodsky (1950); Legare (1957)
C. hamatus: McMurrich (1916)

Morphology:

CR elongate, left CR slightly longer than right (1).

FEMALE TL 1.6-2.1 mm; PLC with asymmetrical sharp spines, right corner larger and directed laterally. Ur three-segmented, gnsgt with abundant and asymmetrical curvature of spines, and with prominent distally directed ventral spine (1).

MALE TL 1.5 mm; PLC shorter than in female, directed backward; right P5 chelate (1).

Distribution and Occurrence:

A neritic species reported from the Sea of Japan, Sea of Okhotsk, Bering Sea and southern Chukchi Sea (1). Locally, abundant in the surface waters of the Strait of Georgia (2) and also reported from the vicinity of the Queen Charlotte Islands (3).

Life History:

Juveniles undescribed; however, the elongate, unequal CR and general body shape should allow identification of the CV.

References:

1) Brodsky, 1950
2) Fulton, 1972
3) Cameron, 1957
Centropages abdominalis

from Mori, 1937
22.1 Lucicutia Giesbrecht, 1898

Morphology:

Ur, CR elongate; PLC rounded; Ro with two slender filaments. Segmentation of P1: 3-1 or 3-2; of P2: 3-3; P2 exp3 with five or six inner setae (1, 2).

FEMALE Ur four-segmented; P1 enp2 with tubular process near inner distal corner; P5 enp with three segments; exp 2 with styliform inner seta.

MALE Ur five-segmented; Ift A1 geniculate. P5 asymmetrical, biramous; rt P5 exp usually two-segmented, enp reduced; Ift P5 rami three-segmented.

References:

1) Brodsky, 1950
2) Hulsemann, 1966
22.1.1 Lucicutia bicornuta Wolfenden, 1905

Synonymy:

Lucicutia aurita: Sars (1905)

Morphology:

A very large copepod characterized by two large, terminally acute apical processes, one on each anterolateral corner of the cephalosome, and two similarly acute processes arising laterally in the Hd region and pointing posteriorly. CR thin and greatly elongate, equal in length to remainder of Ur; Pro:Ur ratio approximately 1.0; Al longer than TL (1, 2).

FEMALE TL 6.8-8.4 mm; gnsgt with large ventral swelling distally (1, 2).

MALE TL 6.9-7.7 mm; Ift A1 geniculate; Ift P5 bp2 with two denticles on inner dorsal corner, rt P5 bp2 smooth (1).

The head shape and extremely long CR distinguish this species from all other local taxa.

Distribution and Occurrence:

Sub-tropical and tropical Atlantic Ocean, northwestern Pacific Ocean, Malay Archipelago, Sea of Japan and Indian Ocean in deep water (1, 2). Locally, reported from Queen Charlotte Strait (3).

Life History:

Juveniles undescribed; however, the cephalosome projections and the elongate CR should allow identification in at least the CV. CV male TL 4.9-5.8 mm (4).

References:

1) Brodsky, 1950
2) Hulsemann, 1966
3) Stone, 1980
4) Vervoort, 1965
Lucicutia bicornuta

from Sars, 1925; Brodsky, 1950; Tanaka, 1983
22.1.2  **Lucicutia flavicornis** (Claus, 1863)

**Morphology:**

Hd rounded, with apical papilla; Pro oval; Pro:Ur ratio approximately 1.5; CR elongate, as long as first two Ur segments combined; A1 reach mid point of CR. P2-P4 exp3 apical spines more than 1/2 length of the segment (1, 2, 3, 4).

**FEMALE** TL 1.3-2.2 mm; P5 enp three-segmented and reaches distal margin of P5 exp2, exp2 with short, recurved, inward directed spine at inner distal corner (1, 2, 3, 4).

**MALE** TL 1.3-1.7 mm; lft P5 bp2 with large inner protuberance bearing long denticles, rt P5 bp2 enlarged and setulose along inner margin, but without defined process (1, 2, 3, 4).

One seta per CR approximately equal to Pro length, when intact a very distinctive feature and unique among the local species.

**Distribution and Occurrence:**

Widely distributed in the Atlantic (73°N to 28°S), Pacific (58°N to 48°S) and Indian Oceans at various depths from near surface to as deep as 3000m (3, 4). Locally, rare, but recorded in samples held in the collection of the Institute of Ocean Sciences.

**Life History:**

Juveniles undescribed, will be difficult to separate from juveniles of **L. ovalis**; however, the relatively short Ur of **L. ovalis** may allow the separation of the CV's.

**Comments:**

Rare in the study area, and may indicate intrusions of equatorial water (5).

(Fiches, Sheet 16)
23.1.1  *Heterorhabdus clausi* (Giesbrecht, 1889)

**Synonymy:**

*Heterochaeta clausii*: Giesbrecht (1892); Wolfenden (1902)

**Morphology:**

A smaller member of the genus; A1 longer than TL; max2 armed with long apical setae (1, 2).

**FEMALE** TL 2.4-2.7 mm; P5 rami with three segments, expl with short spine on inner distal corner, exp2 with very large, inward directed spine at inner distal corner; P5 enp3 reaches proximal margin of exp3 (1, 2).

**MALE** TL 2.2-2.5 mm; P5 biramous, rt P5 bp2 bearing a finger-like, setulose projection from the inner margin, exp2 with short, triangular inner process, exp3 elongate and styliform; lft P5 bp2 with short, rounded, apically setulose swelling on inner margin, exp3 styliform and strongly curved (1, 2).

Separable from *H. papilliger*, the only other small (TL less than 2.8 mm) member of the genus, in the female by the inner distal spine on P5 expl, and in the male by the defined, apically setulose process on the lft P5 bp2 and the finger-like process arising from the rt P5 bp2 (compared with a broadly based process for *H. papilliger*). *H. clausi* is also slightly larger in size.

**Distribution and Occurrence:**

Widespread, but populations usually in isolated patches or small numbers. Reported from the North and South Atlantic, Indo-Pacific, central Pacific, and eastern North Pacific Oceans (2). Locally, reported from Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed. Separable on the basis of size from most similar members of the genus, but cannot be reliably separated from *H. papilliger* except in the adult. The slight size difference between the two may persist in the CV, but there are no size data for *H. clausi* CV.

**References:**

1) Brodsky, 1950
2) Vervoort, 1965
3) Stone, 1980
Heterorhabdus clausi

from Giesbrecht, 1892
23.1.2  **Heterorhabdus papilliger** (Claus, 1863)

**Synonymy:**

*Heterochaeta papilligera*: Giesbrecht (1889); Dahl (1894)

**Morphology:**

A smaller member of the genus; A1 equal to TL (1, 2).

**FEMALE**  TL 1.6-2.2 mm; gns gt ventrally rounded and protruding greatly; P5 with three-segmented rami; exp3 reaches proximal margin of exp3, exp2 bearing large spine at inner distal corner (1, 2).

**MALE**  TL 1.8-2.0 mm; rt P5 exp2 with very long inner process, bp2 with broadly based process on inner margin; lft P5 bp2 lacking any well-defined process from the inner margin, exp3 elongate, falciform (1, 2).

Separable from *H. clausi*, the only other small (TL less than 2.8 mm) member of the genus, in the female by the absence of an inner distal spine from the P5 expl, and in the male by the absence of a well-defined process on the lft P5 bp2, and the broad base of the process on the rt P5 bp2 (compared with a finger-like process with a narrow base for *H. clausi*). *H. papilliger* is also slightly shorter than *H. clausi* in total length.

**Distribution and Occurrence:**

Widely distributed, but rare, over the Atlantic, Indian and Pacific Oceans in deep water, although it may migrate to the surface at night (2). Locally, reported from Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed; however, the size of the CV female is recorded as 1.4-1.5 mm (2). Juveniles cannot be adequately separated from juveniles of *H. clausi*.

**References:**

1)  Brodsky, 1950
2)  Vervoort, 1965
3)  Stone, 1980
Heterorhabdus papilliger

from Mori, 1937; Owre and Foyo, 1967; Park, 1968
Heterorhabdus robustoides Brodsky, 1950

**Morphology:**

Large copepods with PLC rounded but produced slightly backward; Ro of two thin filaments arising from an elongate base; Hd with shallow trench-like depression across middorsal line, visible in lateral view; A1 reach midpoint of Ur; Pro:Ur ratio approximately 2.0; CR elongate, slightly asymmetrical; masticatory edge of rt md with greatly enlarged lateral denticle, lateral denticle on Ift md much smaller; mxp bpl with thin median spine. P1-P4 exp with very broad segments, exp3 with very short outer spines (1).

**FEMALE** TL 4.8-5.0 mm; gnsgt enlarged and equal to combined length of Ur2-Ur4. P5 rami three-segmented, exp2 with large spine arising from inner margin, rt exp2 with short, heavy, acute process arising from inner margin (1).

**MALE** TL 4.6-4.8 mm (1).

Separable from other local members of the genus by its large size, the rounded PLC which extend only slightly backwards, and the large denticle on the masticatory edge of the md, which is on the rt md in *H. robustoides*, but the Ift md in *H. robustus*. Note, however, that in at least one case (2) the large denticle is described as being on the rt md in *H. robustus*. Tanaka (3) suggests that *H. robustoides* and *H. robustus* may be synonymous. We retain separate species, but suggest that type specimens be carefully compared.

**Distribution and Occurrence:**

Reported from the northwestern Pacific and Bering Sea (1).

**Life History:**

Juveniles undescribed; however, the CV should be separable based on size, the placement of the enlarged denticle on the md, and the lack of a large median seta on the mxp bpl.

**References:**

1) Brodsky, 1950
2) Rose, 1933
3) Tanaka, 1964a
Heterorhabdus robustoides

from Brodsky, 1950

369
23.1.4  Heterorhabdus robustus  Farran, 1908

Synonymy:

Heterorhabdus vipera: Farran (1905)

Morphology:

Pro:Ur ratio approximately 1.7; PLC rounded; masticatory edge of Ift md with greatly enlarged lateral tooth; max2 with distal setae strongly developed and spine-like; CR elongate; mxp bpl with a thin, median spine (1, 2).

FEMALE  TL 3.83-4.75 mm (1) (3.05-3.70 (3)); A1 reaches midpoint of Ur. P5 exp2 with large inner edge spine equal in length to length of exp3 (1, 2).

MALE  TL 3.45-4.90 mm; A1 reaches ansgt; rt P5 exp2 with large process on inner margin, bp2 with small inner marginal process; Ift P5 bp2 without process or spinules (1, 2).

Separable from other members of the genus by size, the rounded PLC, the thin spine on the mxp bpl (compared with a thick seta in H. tanneri) and the asymmetry of the mandibular denticles, the largest being on the Ift md (cf. the rt md for H. robustoides) Note, however, that in at least one case (4) the larger denticle is described as being on the rt md in H. robustus. Tanaka (1) suggests that H. robustus and H. robustoides may be synonymous. We retain separate species, but suggest that type specimens be carefully compared.

Distribution and Occurrence:

Widely distributed in the Atlantic, found in various locations in the Pacific, but not widespread there (3). Locally, reported in the Strait of Juan de Fuca (5).

Life History:

Juveniles undescribed; however, the CV and perhaps the CIV should be separable by the presence of a large tooth on the masticatory edge of the Ift md and the absence of such a tooth on the rt md.

References:

1)  Tanaka, 1964a  (Fiches, Sheet 16)

Heterorhabdus robustus

From Rose, 1933

371
23.1.5 Heterorhabdus spinifrons (Claus, 1863)

Synonymy:

Heterochaeta spinifrons: Giesbrecht (1892)

Morphology:

Pro:Ur ratio approximately 2.2; A1 exceeds TL; dorsal papilla produced into a small spine (1, 2, 3).

FEMALE TL 2.8-3.5 mm; P5 exp2 inner distal spine is about as long as exp3 (1, 2, 3).

MALE TL 2.8-3.2 mm; rt P5 bp2 with inner process having a notched margin; lft P5 bp2 with rounded, fringed inner margin (1, 2, 3).

Separable from all other members of the genus by the spinous extension of the dorsal papilla.

Distribution and Occurrence:

Widely distributed, reported from the Atlantic, Pacific and Indian Oceans, and the Norwegian and Mediterranean Seas (1). Locally, reported from Queen Charlotte Strait (4).

Life History:

Juveniles undescribed; however, the spinous extension of the papilla should allow the identification of the CV and probably CIV.

References:

1) Brodsky, 1950
2) Tanaka, 1964a
3) Vervoort, 1965
4) Stone, 1980

372
Heterorhabdus spinifrons

from Giesbrecht, 1892; Esterly, 1905; Tanaka, 1964
23.1.6  *Heterorhabdus tanneri* (Giesbrecht, 1895)

**Synonymy:**

- *Heterorhabdus proximus*: Davis (1949b); Cameron (1957)
- *H. pilosus*: Tanaka (1953)

**Morphology:**

A1 longer than TL by two or more segments; masticatory edges of rt and lft md similar in appearance; mxp bpl armed medially with a stout seta (1, 2).

**FEMALE** TL 3.2-4.1 mm; PLC with short, small wing-shaped processes in lateral view; Pro:Ur ratio approximately 2.1; gns0t enlarged, longer than Ur2, 3 and 4 combined; ventral process of gns0t blunt and protruding in lateral view. Single caudal seta on lft CR 3x TL. Inner distal corner of P5 exp2 with stout spine about 2/3 the length of exp3 (1, 2).

**MALE** TL 3.0-3.9 mm; lft A1 geniculate. rt P5 bp2 with a finger-like projection arising from inner margin, exp1 with a small, inner process bearing a short spine (1, 2).

This species is separable from other members of the genus by the lack of a spine on the dorsal papilla, the symmetry of the masticatory edges of the md's, and the presence of a stout medial seta on the mxp bpl.

**Distribution and Occurrence:**

Northwestern Pacific Ocean, Sea of Okhotsk, and Bering Sea (1). Locally, deep and rare in the Strait of Georgia (3) and reported also from the vicinity of the Queen Charlotte Islands (4).

**Life History:**

Juveniles undescribed, but the characters which separate the species from other members of the genus should also be valid for the CIV and CV.

**References:**

1) Brodsky, 1950
2) Tanaka, 1964a
3) Fulton, 1972
4) Cameron, 1957
Heterorhabdus tanneri

from Koeller, 1974

375
23.2 *Heterostylites* Sars, 1920

**Morphology:**

Hd blunt, with clearly visible dorsal papilla; A1 longer than TL; A2 rami unequal; large denticle on masticatory edge of md not separated from other teeth; distal part of max2 reduced, lacking large spines; CR slightly unequal, with elongate seta on lft CR (1, 2).

**FEMALE** gnsgt protruding ventrally. P5 biramous, symmetrical, exp/enp 3-3. P5 exp2 with long spine; complex crest of fused spines near base of outer spine (1, 2).

**MALE** P5 biramous, asymmetrical; exp, enp 3-3; rt P5 exp2 inflated on inner margin, but without defined process (1, 2).

1) Brodsky, 1950
2) Farran, 1948e (Fiches, Sheet 15)
23.2.1 Heterostylites longicornis (Giesbrecht, 1889)

**Morphology:**

A1 exceeds TL by several segments; A2 rami subequal; max2 with one large curved spine distally; mxp bpl without large, stout median seta (1, 2, 3, 4).

**FEMALE** TL 2.3-3.5 mm; P5 exp2 outer edge spine with a row of smaller spines near its base, inner edge spine long and thin (1, 2, 3, 4).

**MALE** TL 2.7-3.5 mm; lft A1 geniculate; rt P5 bp2 with long, finger-like process on inner margin, exp2 greatly widened (1, 2, 3, 4).

Separable from H. major, the other local member of the genus, by size (less than 3.7 mm for H. longicornis) and the length of the A1 (exceeds TL, but not by as many segments as in H. major).

**Distribution and Occurrence:**

Reported from the Atlantic and Pacific Oceans, including the coast of California (2). Locally, reported from Queen Charlotte Strait (5) and the Strait of Juan de Fuca (6).

**Life History:**

The CV male has been briefly described from a 3.3 mm specimen (1). The Ur is four-segmented, the A1 elongate, and the P5 has two-segmented rami only slightly modified from the regular swimming legs. The other stages have not been described, but the characters used in the key should be sufficient for identification of the CV and possibly CIV.

**Comments:**

Some authors consider the large species of H. major to be a size variant of H. longicornis (1). Rare in the study site, and may indicate intrusions of equatorial water (7).

**References:**

7) Gardner, 1982a
Heterostylites longicornis

from Sars, 1925; Tanaka, 1964
23.2.2  Heterostylites major (Dahl, 1894)

**Synonymy:**

**Heterorhabdus major:** Wolfenden (1911)

**Morphology:**

Pro:Ur ratio approximately 1.8-2.0; A1 longer than TL by at least five segments; max 2 with only one heavy, curved seta distally, the rest of normal size (1, 2, 3, 4).

**FEMALE** TL 4.0-5.2 mm; gnsgt comparatively short; CR asymmetrical, Ift longer than rt. P5 exp2 inner spine thin and elongate, longer than exp3, outer spine with basal crest composed of several cusps (1, 2, 3, 4).

**MALE** TL 3.8-5.4 mm; Ift A1 geniculate; rt P5 exp2 much wider than long, and with a denticulate apex, bp2 with a long, finger-like projection from its inner margin; Ift P5 projecting anteriorly along the inner margin (1, 2, 3, 4).

Separable from H. longicornis, the only other local member of the genus, by its larger size (TL exceeds 3.7 mm) and longer A1.

**Distribution and Occurrence:**

Reported from the northwestern Pacific, North Atlantic, Bering Sea, Sea of Okhotsk, Davis Strait, Baffin Bay and Antarctic (1). Locally, reported from the Strait of Juan de Fuca (5).

**Life History:**

Juveniles undescribed; however, the CV should be separable based on size and the elongate A1.

**Comments:**

Some authors question the validity of H. major, and suggest that it may be a size variant of H. longicornis (2).

**References:**

2) Tanaka, 1964a
3) Vervoort, 1965
4) Farran, 1948e (Fiches, Sheet 15)
5) Chester et al., 1980
Heterostylites maior
from Sars, 1925, Tanaka, 1964
24.1  **Centraugaptilus** Sars, 1920

**Morphology:**

Large to very large copepods; Ro heavily chitinized, in form of a notched plate directed downward or obliquely downward and forward; A1 shorter than Pro; mxp masticatory edge with two long, thin denticles and one shorter, median denticle; some distal setae of mxp curled over at the tip and bearing shield-shaped structures distally. CR short; Ur short; P5 biramous with two- or three-segmented rami (1, 2).

**FEMALE**  Ur three-segmented; P5 exp usually three-segmented (1, 2).

**MALE**  Ur five-segmented; P5 asymmetrical, exp with two or three segments (1, 2).

The local species of this genera is the only calanoid with total body spination found in the study area.

**References:**

1)  Brodsky, 1950
2)  Owre and Foyo, 1967
24.1.1 Centraugaptilus porcellus Johnson, 1936

Morphology:

Pro broad, especially in the female; surface of body and appendages spinulose; Ro two rotund, widely-separated rami which are enlarged near their base; Al short; Ur very short; masticatory edge of md with one short median tooth and two long lateral teeth. P1,2 segmentation: 3-2/3-3 (1, 2).

FEMALE TL 6.0-6.2 mm; Ro not visible in dorsal view; Ur three-segmented (1, 2).

MALE TL 5.75 mm; Ift Al geniculate, Ro visible in dorsal view. P5 bp2 with small spinous protuberance on inner edge (1, 2).

Within the study area, only one other species has a densely spinulose body surface, the cyclopid Pseudolubbockia dilatata.

Distribution and Occurrence:

Reported only from the North Pacific (1). Locally, reported from Queen Charlotte Strait (3).

Life History:

Juveniles undescribed; however, the characteristic body spination and pronounced Ro should allow identification of the CV and CIV.

Comments:

Centraugaptilus porcellus is the only species of the genus which has been reported from the study area.

2) Johnson, 1936
3) Stone, 1980
Centraugaptilus porcellus
From Johnson, 1936
24.2 Haloptilus Giesbrecht, 1898

Synonymy:

Hemicalanus (part): Claus (1863)

Morphology:

Hd profile occasionally papillate; Ro of two thin filaments; thorax usually four-segmented. Ur short; A2 enp much longer than exp; masticatory edge of md with two large denticles; max2 reduced; mxp with large enp; P5 biramous, exp, enp three-segmented (1).

FEMALE Ur four-segmented; P5 exp2 usually with elongate inner setae (1).

MALE Ur five-segmented; Ift A1 geniculate; P5 rami not greatly modified (1).

24.2.1  *Haloptilus oxycephalus* (Giesbrecht, 1889)

**Synonymy:**

*Hemicalanus oxycephalus*: Giesbrecht (1892)

**Morphology:**

Ur short; A1 longer than TL; A2 exp twice length of A2 enp (1, 2, 3, 4, 5).

**FEMALE** TL 3.0-4.1 mm; Hd with elongate, apical spine; Pro:Ur ratio about 6; each PLC produced into a long spine. P5 absent (2).

**MALE** TL 2.5-2.9 mm; Hd rounded. P5 biramous, asymmetrical; exp-enp segmentation 3-3; lft bpl inner margin with hook. Exp armed with spines but devoid of setae (3).

**Distribution and Occurrence:**

Reported from the tropical Pacific, Mediterranean Sea and Atlantic Ocean (1, 4). Locally, reported from Queen Charlotte Strait (5).

**Life History:**

Juveniles undescribed; however, the head spine and short Ur should allow identification of the CV and probably CIV.

**Comments:**

The only species of the genus *Haloptilus* reported from the study area.

**References:**

1)  Mori, 1937

24.3.1 Pachyptilus pacificus Johnson, 1936

Morphology:

**FEMALE** TL 5.8-6.3 mm; Ur short, four-segmented; A1 exceeds TL; Ro of two long filaments; PLC with angular profile; masticatory edge of md broad, with one large, lateral tooth separated from the other teeth. P1,2 segmentation: 3-2/3-3; P5 biramous with three-segmented exp and one segmented enp (1, 2).

**MALE** Undescribed.

Easily separated from the smaller Lucicutia ovalis (TL 1.2-1.8 mm) but similar in general body shape and A1 length.

Distribution and Occurrence:

Northwestern Pacific Ocean, Bering Sea (1). Locally, reported from Queen Charlotte Strait (3).

Life History:

Juveniles undescribed; however, the broad Pro, short Ur and long A1 should allow identification in the CV.

Comments:

The only local member of the genus Pachyptilus.

References:

1) Brodsky, 1950
2) Johnson, 1936
3) Stone, 1980
Pachyptilus pacificus from Johnson, 1936
25.1 Arietellus Giesbrecht, 1892

**Morphology:**

Large copepods, with Hd usually apically acute; PLC elongate, often acute; Ro two thin filaments; A1 short; A2 enp longer than exp; max2 with prominent spines. P1,2 segmentation 3-3/3-3 (I).

**FEMALE** P5 uniramous, reduced, three-segmented (I).

**MALE** Lft A1 geniculate; P5 biramous, but enp rudimentary (I).

**References:**

1) Brodsky, 1950
25.1.1 **Arietellus plumifer** Sars, 1905

**Morphology:**

Hd with sharp apical process visible in lateral view; PLC elongate with acute tips which may curve to a point directed postero-dorsally; Ro of two thin filaments; A1 short; A2 enp longer than exp (1, 2, 3).

**FEMALE** TL 4.6-5.6 mm; P5 uniramous, three-segmented, 2P5 widened at distal edge (1, 2, 3).

**MALE** TL 5.0-5.9 mm; A1 geniculate. P5 biramous with rudimentary enp, exp three-segmented (1, 2, 3).

Characterized by the relatively thin Ro, the dominance of the enp in the A2 and the presence of three-segmented rami in P1-P4. Separable from other medium-sized copepods by the distinctive P5 (male and female).

**Distribution and Occurrence:**

Widely distributed in the North Atlantic from about 4°N to 70°N; also reported from the Indo-Pacific and the central and eastern Pacific Ocean (3). Locally, reported from Queen Charlotte Strait (4).

**Life History:**

Juveniles undescribed; however, the characters used to identify the species should also be valid for at least the CV.

**Comments:**

This is the only species of *Arietellus* reported from the study area.

**References:**

1) Rose, 1933  
2) Grice, 1962  
3) Vervoort, 1965  
4) Stone, 1980
Arietellus plumifer

from Sars, 1925
25.2  **Phyllopus** Brady, 1883

**Morphology:**

Copepods of moderate size; gnsgt sometimes asymmetrical; A1 short; A2 enp much shorter than exp; labrum large and protruding (1).

**FEMALE** Ur four-segmented; P5 uniramous, five-segmented; 3P5 with long, thin inner bristle (1).

**MALE** Ift A1 geniculate; Ur five-segmented; Ift P5 with large enp, rt P5 uniramous (1).

Separable from other medium-sized copepods by the distinctive P5 (male and female).

**References:**

1) Brodsky, 1950
25.2.1  *Phyllopus integer* Esterly, 1911

**Synonymy:**

*Phyllopus bidentatus* Esterly (1905)

**Morphology:**

PLC elongate, acute, somewhat asymmetrical in lateral view due to a small depression on dorsal side of apex; Ro single, short, massive; A1 short; gns gt half length of Ur. P1,2 segmentation: 3-3/3-3 (1, 2).

**FEMALE**  TL 3.53 mm (1, 2).

**MALE**  TL 2.64 mm; lft P5 distal segment extremely broad (1).

**Distribution and Occurrence:**

Reported from the Pacific Ocean near the coast of California (2). Locally, reported from Queen Charlotte Strait (3).

**Life History:**

Juveniles undescribed; key valid for adults only.

**Comments:**

This is the only species of *Phyllopus* reported from the study area. Esterly's earlier (4) report of this species as *P. bidentatus* is doubtful due to the much smaller size of his specimens (2.2 mm TL).

**References:**

1) Esterly, 1911  
2) Brodsky, 1950  
3) Stone, 1980  
4) Esterly, 1905
Phyllopus integer
from Esterly, 1911
Morphology:

Hd blunt, with conspicuous construction in dorsal view; PLC spiniform, often asymmetrical; gnsgt often spinous and/or asymmetrical. CR short; max2 modified, armored distally with one or two large, scythe-shaped bristles; mxp reduced; masticatory edge of mandible with basal tooth divided into one or more pointed cusps (1, 2).

**FEMALE** Ur three-segmented; P5 uniramous, symmetrical, three-segmented with serrate outer margin (1, 2).

**MALE** Ur five-segmented; P5 uniramous, asymmetrical; rt P5 three-segmented with bifid terminal segment; lft P5 two-segmented (1, 2).

The unusually blunt Hd shape, large max2 and gnsgt separate this genus from other local copepods.

References:

1) Brodsky, 1950
2) Grice, 1963
26.1.1 Candacia bipinnata (Giesbrecht, 1889)

Synonymy:

Candace truncata: Brady (1883)
Candacia pectinata: Esterly (1905); Mori (1937)

Morphology:

A small copepod with a blunt Hd constricted at its base in dorsal view; max2 enlarged and armed distally with several stout, scythe-like setae; PLC acute (1, 2, 3, 4).

FEMALE TL 2.2-2.7 mm; gnsgt with acute lateral projections; P5 lacking deep apical notches (1, 2, 3, 4).

MALE TL 2.1-2.5 mm; rt PLC larger than lft and extended further distally; gnsgt with acute lateral projection on rt side only; rt P5 shorter than lft (1, 2, 3, 4).

The female of the other local species, C. columbiae, has no gnsgt lateral projections and the male has a much longer single gnsgt lateral projection. C. bipinnata is smaller in size.

Distribution and Occurrence:

Widely distributed in the Atlantic, Pacific and Indian Oceans (4). Locally, reported from Queen Charlotte Strait (5) and rare in the Strait of Georgia (6).

Life History:

Juveniles undescribed; however at least the CV should be identifiable based on the well-armed max2.

Comments:

Rare in the study area, and may indicate intrusions of equatorial water (7).

References:

1) Mori, 1937
2) Grice, 1963b
3) Tanaka, 1964c

7) Gardner, 1982a
Candacia bipinnata

from Brodsky, 1950, 1982
26.1.2 Candacia columbiae Campbell, 1929

Synonymy:

Candacia pacifica: Mori (1937)

Morphology:

Hd blunt, constricted at base in dorsal view; A1 long; max2 armed distally with several heavy, scythe-like setae; gns gt asymmetrical on rt side (1, 2, 3).

FEMALE TL 3.7-4.1 mm; P5 uniramous, segmented, distal segment elongate and with a deeply notched apex (1, 2, 3).

MALE TL 3.2-4.5 mm; gns gt with complex, thin, apically bifurcate projection arising from lateral margin and extending perpendicular to the long axis of the Ur; rt PLC elongate and directed medially (1, 2, 3).

The female of the other local species, L. bipinnata, has two gns gt lateral projections and the male has a single reduced lateral projection. C. columbiae is larger in size.

Distribution and Occurrence:

Northwestern Pacific, Bering Sea, and Sea of Okhotsk (2). Locally, deep and rare. Originally reported from the west coast of Vancouver Island (1), and more recently from the Strait of Georgia (4) and the Queen Charlotte Islands (5).

Life History:

Juveniles undescribed; however, at least the CV should be identifiable based on size, the constricted Hd profile and the well-armed max2.

References:

1) Campbell, 1929b
2) Brodsky, 1950
3) Grice, 1963b
4) Legare, 1957
5) Cameron, 1957
Candacia colombiae

from Campbell, 1929; Brodsky, 1950
27.1 *Epilabidocera* Wilson, 1932

**Synonymy:**

*Paralabidocera*: McMurrich (1916)

**Morphology:**

Hd with pair of cuticular lenses visible in dorsal view; Hd armed laterally with backward directed hooks; Ro prominent, with strong filaments; PLC spinous or with acute, often asymmetrical, processes; ansgt short; P1,2 segmentation: 3-3/3-2' (1).

**FEMALE** Cuticular lenses small, Ur three-segmented; Ur and CR asymmetrical; P5 bp with two segments. Exp and enp symmetrical, one-segmented, often rudimentary (1).

**MALE** Cuticular lenses large; rt Al geniculate; Ur four- or five-segmented; P5 uniramous, asymmetrical, four-segmented, checlate; Ift P5 with rudimentary enp (1).

The distinctive PLC cuticular lenses and Ro separate this genus from all other local calanoids.

**References:**

1) Brodsky, 1950
27.1.1  **Epilabidocera longipedata** (Sato, 1913)

**Synonymy:**

- *Epilabidocera amphitrites*: Davis (1949b); Brodsky (1950); Cameron (1957); Legare (1957); Fulton (1968, 1972)
- *Paralabidocera amphitrites*: McMurrich (1916); Willey (1920); Esterly (1924); Campbell (1929b)

**Morphology:**

- **Hd** with two cuticular lenses; **Al** and **Ur** short (1, 2).
- **FEMALE** TL 3.2-4.0 mm; cuticular lenses small; **PLC** asymmetrical, sometimes with an acute spine on **lf** PLC. **P5** biramous, one-segmented exp and enp (1, 2).
- **MALE** TL 2.3-3.0 mm; cuticular lenses large; **PLC** acute and asymmetrical, **rt** **PLC** thinner and longer. **rt** **Al** geniculate; **rt** **P5** chelate (1, 2).

**Distribution and Occurrence:**

- Coastal in the North Pacific (1). Locally, common and surface living; reported from the Strait of Georgia (1, 3) and the Queen Charlotte Islands (4).

**Life History:**

- All naupliar and juvenile copepodite stages have been described (5). The paired eyes and lateral head hooks identify all copepodite stages except the Cl.

Epilabidocera longipedata
from Park, 1966
28.1  *Acartia* Dana, 1846

**Morphology:**

Body slender, Hd bluntly rounded in dorsal view; PLC rounded; A2 exp shorter than A2 enpl; A2 bp fused with enpl; CR short. P1,2 segmentation: 3-2/3-2; P1 exp1,2 each with long, slender outer distal spine (I).

**FEMALE** Ur three-segmented; P5 uniramous, three-segmented, 3P5 modified into long, slender spine (I).

**MALE** Ur five-segmented; rt A1 slightly geniculate. P5 uniramous; rt P5 longer than lft, with three to five segments, rt 2P5 with large inner lobe, lft P5 with two or four segments (I).

The blunt head, short CR and A1, and small size separate this genus from similar local taxa.

**References:**

1) Bradford, 1976
28.1.1 Acartia cf. clausi Giesbrecht, 1889

Morphology:

PLC rounded, may be bordered with minute dorsal spines and ventral stiff hairs; Ro absent (1).

FEMALE TL 0.8–1.4 mm; gnsgt and Ur2 with conspicuous spines on dorsal distal margin (1).

MALE TL 0.8–1.2 mm; gnsgt with dorsal hairs along distal margin (1).

Easily separated from other local members of the genus by the absence of a Ro and the PLC without ornamentation.

Distribution and Occurrence:

Verified occurrences only from the North Atlantic and adjacent waters. Locally, reported as A. clausi as common in the Strait of Georgia (2, 3, 4) and also from the Queen Charlotte Islands (5). Local identifications may include other Acartia species (see comments).

Life History:

Juvenile Acartia clausi obtained from the Atlantic Ocean have been well studied. The naupliar stages have been described (6, 7). Copepodites have also been described (6, 7, 8).

Acartia cf. clausi
from Bradford, 1976

28.1.1
28.1.2  *Acartia danae* Giesbrecht, 1889

**Morphology:**

Ro present, PLC spiniform; distinct spine on 1A1 (1, 2).

**FEMALE** TL 1.0-1.3 mm; Ur 1, 2 spinulose along dorsal margin; P5 reduced, two-segmented; 2P5 armed with a long, plumose setae; 3P5 elongate, with denticulate distal margin (3).

**MALE** TL 0.7-0.8 mm; Ur I with lateral bristles; P5 asymmetrical; 1,2P5 each with a short medial protuberance from the inner margin; rt P5 four-segmented; lft P5 three-segmented (3).

Easily separated from other local species in the genus by the presence of a Ro and spiniform processes on the PLC.

**Distribution and Occurrence:**

Reported from the Pacific and Atlantic Oceans (1). Locally, reported from the Strait of Juan de Fuca (4).

**Life History:**

Juveniles undescribed, but should be similar in general form to *A. clausi* (5).

**References:**

1) Mori, 1937
2) Davis, 1949b
3) Rose, 1933

Acartia dariae from Rose, 1933; Brodsky, 1962

Acartia danae
from Rose, 1933; Brodsky, 1962
28.1.3 *Acartia longiremis* (Lilljeborg, 1853)

**Morphology:**

Ro absent, PLC each with a long, sharp dorsal spine; ansgt finely spinose (I).

**FEMALE** TL 1.0-1.3 mm (I).

**MALE** TL 0.9-1.0 mm; rt 2P5 with spine on inner margin; lft 4P5 broadening distally (I).

Easily separated from other local species of the genus by the absence of a Ro and by the distinct PLC spines; both these features are best seen in lateral view.

**Distribution and Occurrence:**

Widespread in the North Atlantic; the Baltic, Black and Bering Seas; and the Seas of Japan and Okhotsk (I). Locally, reported as abundant in the surface waters of the Strait of Georgia (2, 3, 4), the Strait of Juan de Fuca (5) and the Queen Charlotte Islands (6).

**Life History:**

Juveniles undescribed, but should be similar in general form to those of *A. clausi* (7).

**References:**

7) Conover, 1956
Acartia longiremis
from Sars, 1903
28.1.4  *Acartia californiensis* Trinast, 1976

**Morphology:**

PLC rounded, with or without spines, Ro present (1).

**FEMALE**  
TL 0.96-1.04 mm; Pro:Ur ratio approximately 3.2; Hd slightly vaulted; PLC with or without two small spines on each side; P5 terminal spine with bulbous base, spinules limited to central part, external seta nearly as long as terminal spine (1).

**MALE**  
TL 0.87-0.96 mm; Pro:Ur ratio approximately 2.9; PLC with or without one small dorsal spine and several (3-6) more slender, ventral setae on each side; rt 2P5 with bilobed inner protuberance bearing small spine on distal margin, lft 3P5 terminating in long blunt apical spine, slightly flexed, and slender, simple accessory subapical spine (1).

Easily separated from other local members of the genus by the presence of a rostrum and ornamentation of PLC.

**Distribution and Occurrence:**

Rare in the study area. Reported from the Strait of Georgia near San Juan Island (2).

**Life History:**

Juveniles undescribed, but should be similar in general form to those of *A. clausi* (3).

**References:**

29.1.1 *Tortanus discaudatus* (Thompson and Scott, 1897)

**Morphology:**

Ur elongate; CR long and greatly asymmetrical; Ro absent; PLC produced and blunt (1).

**FEMALE** TL 1.4-2.3 mm; Ur three-segmented (1).

**MALE** TL 1.3-2.0 mm (1).

**Distribution and Occurrence:**

Coastal waters of the southern Chukchi Sea, Bering Strait, Sea of Japan, North Sea and North Atlantic (1). Locally, a common surface-living species reported from the Strait of Georgia (2, 3, 4) and Queen Charlotte Islands area (5).

**Life History:**

All juvenile stages have been described (6). The naupliar stages are illustrated in the introductory sections of the key (Fig. 4).

PART II

ANNOTATED BIBLIOGRAPHY AND ANCILLARY REFERENCES
INTRODUCTION

This Annotated Bibliography forms the second of two parts on the British Columbia Pelagic Marine Copepoda. An explanation of synonyms is provided in Part I: "British Columbia Pelagic Marine Copepoda: An Identification Manual". The list of pelagic, marine copepods was compiled from the literature on zooplankton distributions in the study area and from samples collected by the Ocean Ecology Laboratory, Institute of Ocean Sciences in that area.

The Bibliography was developed from information available through library sources and the personal literature files of J. D. Fulton, C. C. Davis and G. A. Gardner, and is divided into two sections. The literature reviewed in the first section was selected for its taxonomic value. All references judged to be useful in the identification of juvenile and adult copepods are annotated. All pertinent species are named unless more than ten local species are described, in which case the new species descriptions are identified and the total number of species is noted. References included in the second section deal more with ecological and distributional aspects than with taxonomy. Most of these references refer directly to one or more local species; others contain relevant information on species closely related to local taxa.

If a given author or authors had more than one publication in a single year, letter designations following the year were added for clarification. In some instances, the first letter designated will be found in the Ancillary References and the second in the Annotated section. This is due to later-stage additions of material in which the first reference had already been extensively cited in the Identification Manual. Because citations for some publications listed in Ancillary References were obtained from secondary sources rather than from examination of original works they may occasionally be incomplete.

All references are arranged alphabetically by author. The Annotated Section includes a systematic index to the orders Calanoida, Cyclopoida, Monstrilloida, and Harpacticoida, plus separate entries for naupliar and copepodite stages. Within each Order, the genera and species are arranged alphabetically.
The genus Calocalanus is subdivided into three genera (Calocalanus, Leptocalanus, Dolichocera) and it is suggested that this group should comprise a new family, the Calocalanidae. Full family and generic descriptions are given. Two new species (C. pseudocontractus, L. equalicauda) and males of previously existing species (C. pavo, L. plumulosus, D. tenuis) are described.

Geog. Loc.: Atlantic and Pacific Oceans.
Local Taxa: *Aetideus*.
Annot. Source: Author's abstract.

The genus *Euaetideus* Sars, 1925 is merged with *Aetideus* Brady, 1883 (Copepoda: Calanoida: Aetideidae). Three new species of the genus *Aetideus* (*A. pseudarmatus*, *A. divergens*, *A. truncatus*) are described from the Pacific as well as the males of three other known species (*A. giesbrechti*, *A. acutus*, *A. bradyi*). A key is given to the known males and females in the genus *Aetideus*. The closely related genera *Paivella* and *Snelliaetideus* are compared with *Aetideus*.

Geog. Loc.: Southwestern Pacific.
Local Taxa: *Heterorhabdidae, Heterohabdus tanneri, H. proximus*.
Annot. Source: Modified author's abstract.

Three new species of calanoid copepods are described. They are *Heterohabdus spinosus*, *H. lobatus*, and *Disseta magna*. The males *H. pustulifer* and *H. caribbeanensis* are discussed and the identities of *H. proximus*, *H. norvegicus* and *H. australinus* are clarified. *H. spinifer* is recorded for the second time. A key to the subgenus *Heterohabdus* is provided.
The families Phaennidae and Scolecithricidae are redefined. The scolecithricid genera Scolecithrix, Scolecithricella, Amallothrix, Scaphocalanus and Lophothrix are redefined. It is suggested that the species Scolecithrix ctenopus, S. auropecten, S. fowleri and Amallophora altera represent four groups of species which probably should be given generic status. A new species of Parundinella is named and a juvenile Neoscolecithrix is described.

A new species, Bradyidius hirsutus, is described. The author transfers four species previously attributed to Bradyidius to the genus Pseudotharybis. A table is given comparing the remaining ten species of Bradyidius and summarizing the differences between them.
Specimens of the Acartia subgenus Acartiura which are closely related to A. clausi Giesbrecht, 1889 were examined from European waters, the east and west coasts of the United States, Japan, Australia, and New Zealand. The species A. ensifera Brady, 1899 and A. simplex Sars, 1905 are redescribed, A. hudsonica Pinhey, 1926 is elevated from subspecific to specific status, and five new species (A. jilletti, A. lefevreae, A. omorii, A. teclae, and A. tranteri) are described. A key is given to all known species of Acartiura.

Geog. Loc.: Southwestern Pacific.
Local Taxa: Euchirella rostrata, E. curticauda, Chirundina streetsi, Gaetanus miles, G. pileatus, Gaidius minutus, G. pungens.
Annot. Source: Modified authors' abstract.

The distribution and taxonomy of aetideid calanoid copepods from the southwestern Pacific in the vicinity of New Zealand is recorded. All genera in the Aetideidae are defined and a list of species provided. Many species are fully described and illustrated.

Geog. Loc.: Northeastern Atlantic.
Local Taxa: Corycaeus anglicus.
Annot. Source: Summary of text.

This is a three volume series on the marine calanoids, cyclopooids, harpacticoids and monstrilloids obtained from the coast of the British Islands. The discussion of the species is more in the form of taxonomic notes than full descriptions. Each volume has numerous plates.

Local Taxa: Calanus pacificus.
Annot. Source: Summary of text.

A comprehensive account of thirty-nine calanoid, seven cyclopoid and four harpacticoid species is presented. Illustrations are gathered into thirty-two plates.

Geog. Loc.: Eastern seas and polar basin of the U.S.S.R.
Local Taxa: Calanoida.
Annot. Source: Summary of text.

Using the systematic organization of Sars (1903) the calanoid copepods found in the eastern seas and polar basin of the U.S.S.R. are described and illustrated. Taxonomic revisions are made and many new species and genera are described. The new taxa are: Aetideus pacificus, Pseudochirella polypina, Scolecithricella minor var. orientalis, Metridia okhotensis, M. pacificus, Pleuromamma scutulata, Spinocalanus brevicaudatus, Gaidius variabilis, and Heterorhabdus robustoides. Eighty-one species discussed by Brodsky have been reported from British Columbia coastal waters.

Geog. Loc.: Global.
Local Taxa: Calanus pacificus.
Annot. Source: Modified author's conclusion.

The species Calanus glacialis, C. finmarchicus, C. helgolandicus, C. pacificus, C. australus and C. chilensis, each morphologically distinct, are shown to occupy discrete geographical regions having different ecological backgrounds. Calanus finmarchicus is thought to be the super species with the others being diverged recently as a result of penetration into different geographic regions.

Local Taxa: Calanus pacificus, Neocalanus plumchrus, N. cristatus, Mesocalanus tenuicornis, Eucalanus bungii, Mecynocera clausii, Clausocalanus arciicornis, Lucicutia flavicornis, Haloptilus oxycephalus, Candacia bipinnata, Acartia danae.
Annot. Source: Summary of text.

A list of 95 species of calanoid copepods is given for the eastern coast of the Kuril Islands. Taxonomic notes for 33 species, many of which are illustrated, are presented. Distribution density maps of the eight most common species are discussed.

Geog. Loc. Northern hemisphere.
Local Taxa: Calanus pacificus.
Annot. Source: Summary of text.

The geographical centre of origin for Calanus spp. is concluded by the author to be in the high latitudes of the northern hemisphere. Graphical results of comparative morphological analysis of the structure of the fifth pair of swimming legs of Calanus spp. males show an increase in asymmetry of the exopodites from the north to the south pole. The presence of a phylogenetic series is discussed.

Geog. Loc.: British Columbia, northeastern Pacific.
Local Taxa: Candacia columbae, Ascomyzon rubrum.
Annot. Source: Summary of text.

Twenty-one species of marine calanoids, six species of cyclopoids, and five species of harpacticoid copepods discussed are found in B.C. coastal waters. Many of the species are now known under different names. Three new species are described: Candacia columbae, Ascomyzon rubrum, and Zaus caeruleus.

Geog. Loc: Vancouver Island region, northeastern Pacific.
Local Taxa: Gaetanus intermedius, Neocalanus plumchrus, Macrocheiron sargassii.
Annot. Source: Modified author's abstract.

Five species are described; three, Gaetanus intermedius, Eurytemora transversalis, and Tigriopus triangulus are new to science. The male of Calanus tonsus Brady is described, and Macrocheiron sargassii Sars is described and reported for the first time from the northeastern Pacific Coast.

Geog. Loc.: Strait of Georgia, northeastern Pacific.
Local Taxa: Neocalanus plumchrus, Euchaeta elongata.
Annot. Source: Modified author's abstract.

All six naupliar and six copepodite stages of Calanus tonsus Brady and Euchaeta japonica Marukawa are described and illustrated. All specimens used in this study were collected from the Strait of Georgia, B.C. Experiments in rearing these two species were not successful.

Geog. Loc.: Northwestern Atlantic, northeastern Pacific.
Local Taxa: Acartia cf. clausi.
Annot. Source: Author's abstract.

An attempt was made to interbreed populations of Acartia clausi from Woods Hole, Massachusetts, and Yaquina Bay, Oregon. Individuals from these populations are morphologically similar, but differ somewhat in size. Cultures from both sources produced many successive generations in the laboratory, but interbreeding with production of viable offspring did not occur. This is evidence that the Atlantic and Pacific populations have diverged in isolation to the level required to be assigned species rank.

Geog. Loc.: North Sea.
Local Taxa: Pseudocalanus sp.
Annot. Source: Summary of text.

Six samples collected in the North Sea between February and June 1947 contained a significant number of Pseudocalanus minutus parasitized by Blastodinium contortum hyalinum (a parasitic dinoflagellate). This parasite causes castration of the host. The external morphology of infected Stage V male and female copepodites and adult females is unaffected. In adult males, however, typical Stage V fifth swimming legs and a mature female genital segment are present. Copulation was observed between these superficially mature but sterile females and unparasitized adult males.

Geog. Loc.: Shimonoseki Harbour, northwestern Pacific.
Local Taxa: Eurytemora pacifica.
Annot. Source: Summary of text.

The male and female of Eurytemora pacifica are redescribed and illustrated.

Geol. Loc.: Bikini Atoll, northwestern Pacific.
Local Taxa: Pleuromamma xiphias, Candacia bipinnata.
Annot. Source: Summary of text.

An investigation of the impact of the hydrogen bomb explosion at Bikini Atoll on the zooplankton of that area was conducted, including illustrated taxonomic notes on eight juvenile copepodites. It is concluded that no species of zooplankton was seriously affected by the fission products.

Geog. Loc.: Long Island Sound, northwestern Atlantic.
Local Taxa: Acartia cf. clausi.
Annot. Source: Author's abstract.

The effects of environment on Acartia clausi and A. tonsa are studied through a combination of field and laboratory studies. The developmental stages of both species are fully described, and various physiological and ecological data presented.

Geog. Loc.: Dalhousie University, Nova Scotia, Canada.
Local Taxa: Pseudocalanus.
Annot. Source: Modified English summary.

The copepodites and first naupliar stage of Pseudocalanus elongatus are fully described. The antennules of all copepodite and adult stages of Temora longicornis are described.

Geog. Loc.: Dalhousie University, Nova Scotia, Canada.
Local Taxa: *Pseudocalanus* cf. *minutus*.
Annot. Source: Summary of text.

The systematics and ecology of *Pseudocalanus* is fully described, and the naupliar and copepodite stages are illustrated.

Geog. Loc.: Straits of Messina, Ionian Sea.
Local Taxa: *Pleuromamma abdominalis*.
Annot. Source: Summary of text.

The genus *Pleuromamma* is represented in the Straits of Messina by *P. abdominalis* and *P. gracilis*. The author notes frequency of males, females and copepodite stages as well as illustrating and describing copepodite stages III and V for *P. abdominalis* and copepodite stage V for *P. gracilis*.

Geog. Loc.: Mediterranean Sea.
Local Taxa: Acartia, Paracalanus, Centropages.
Annot. Source: Summary of text.

Muff-shaped formations were found on the anal segments of several species of marine copepods collected in the northeastern Atlantic. They are thought by the author to be intestinal prolapses triggered by man-produced hydrocarbons or pabulum introduced into the marine environment.

Local Taxa: Pleuromamma xiphias, P. abdominalis, P. quadrungulata, P. robusta, P. borealis.
Annot. Source: Summary of text.

A key to the identification of six species of Pleuromamma is presented. Three species, P. quadrungulata, P. borealis and P. robusta are new to science and are described. No illustrations are included.
The systematic position of the Spinocalanidae is reconsidered; all published descriptions and records are discussed. Several critical type specimens and specimens forming the bases of widespread records have been examined and are redescribed. Keys to the genera and all of the species have been prepared, with the goal of enabling an investigator to identify even damaged specimens. Many named species or forms have been placed in synonymy, and two new species (Spinocalanus terranovae and Mimocalanus heronae) are described. The family is now considered to comprise 32 species, distributed as follows: Spinocalanus (19), Monacilla (4), Mimocalanus (8), and Teneriforma (1).

All the naupliar and copepodite stages of Eurytemora hirundoides (Nordquist) are described and illustrated in great detail. The introduction contains a section on the history of the study and culturing of juvenile copepods of all orders from both fresh and saltwater habitats.

Geog. Loc.: Chicken Key, Florida, central and western Atlantic.
Local Taxa: Monstrilla.
Annot. Source: Summary of text.

Based on the description of two new species, Monstrilla reticulata and Monstrilla floridana, the number of genera in the family Monstrillidae of the copepod sub-order Monstrilloida are reduced. The author considers the genera Monstrilla and Monstrillopsis too similar to warrant a distinction. The same applies for the genera Thamaleus and Cymbasoma. The generic names Monstrilla and Thamaleus take precedence. Since there is a tendency towards fusion of the urosome segments, it is suggested that only one genus may be valid in the family Monstrillidae. A dichotomous key of the 35 known species of Monstrilloida is given. No illustrations accompany this key.

Local Taxa: Calanoida, Cyclopoida, Harpacticoida, Cyclopoida.
Annot. Source: Summary of text.

A list of 91 species of pelagic copepods occurring in the region of the Pacific Ocean from San Francisco Bay to the Aleutian Islands is given. Taxonomic descriptions, synonymy, distribution and remarks are included for all the adult stages.
A total of 64 species of marine copepods found off San Diego are discussed. Giesbrecht's 1892 key to genera plus 60 of his species descriptions are translated and included. Four new species (Labidocera trispinosa, Scolecithrix pacifica, S. subdentata, Sapphirina lomae) are described and illustrated. Twenty-seven of the species discussed occur in British Columbia coastal waters.

Twenty-seven species of calanoids are discussed, eighteen of which are new to science with Euchaeta californica being the only one reported from British Columbia waters. Four other species discussed (Chirundina streetsi, Euchirella curticauda, Heterorhabdus longicornis, H. spinifrons) are also known to occur in British Columbia coastal waters.

Geog. Loc.: San Diego, California.
Local Taxa: Euchirella rostrata, Gaidius pungens, Phyllopus interger, Undeuchaeta bispinosa.
Annot. Source: Summary of text.

Twenty-eight species of calanoids are described and illustrated. Phyllopus integer, Undeuchaeta bispinosa, and twenty other species are described for the first time.

Geog. Loc.: San Diego, California.
Local Taxa: Euchaeta elongata.
Annot. Source: Summary of text.

Brief descriptions and figures are given for 12 new species of calanoid copepods. They are Arietellus pacificus, Augaptilus californicus, A. depressus, A. romanus, A. simplex, Euchaeta elongata, Gaetanus ascendens, Scolechithrix aculeata, S. elephas, S. longirostris, S. mollis, and S. obscura.
Part 1 contains species and genera descriptions of eleven pelagic calanoids collected by the "Albatross" in San Francisco Bay. Part II discusses the vertical and geographical distribution and occurrence of the calanoids.

This doctoral thesis investigated whether or not, within the geographic range of an organism, variations in water quality are an important environmental variable in determining species abundance. The data showed that differences in abundance could be better explained by differences in primary production and in the origin and residence time of the water. Although seawaters within the study area may vary in quality, these variations probably do not significantly affect species abundance and distribution.

Geog. Loc.: Narragansett Bay, R.I., northwestern Atlantic.
Local Taxa: Pseudocalanus, Eurytemora affinis, E. americana, Acartia, Tortanus discadatus.
Annot. Source: Author's abstract.

Zooplankton surface samples were taken with a No. 12 silk bolting cloth net towed by a Clark-Bumpus quantitative plankton sampler in Narragansett Bay for 12 months. Ten calanoid, three cyclopoid, and one harpacticoid species of free-swimming copepod nauplii were collected. The structure and arrangement of elements of the caudal armatures of these copepod nauplii were used to formulate the illustrated key included in this paper.

Local Taxa: Oithona plumifera, Oithona spinirostris.
Annot. Source: Summary of text.

Oithona spinirostris and Scibella scibsa are found to be junior synonyms of Oithona plumifera. The possibility of Oithona challengeri being a synonym of Oithona setigera is suggested. Two new species, Oithona atlantica and Oithona pelagica are described.
Since 1939, the International Council for the Exploration of the Sea has published a series of zooplankton sheets. These short illustrated leaflets are not intended to be used as a short cut to the identification of northeastern Atlantic zooplankton but as guides to the current taxonomic position of each family with references to the best literature for their identification.

The list of these publications is as follows:

455

Geog. Loc.: Gulf of Mexico.
Local Taxa: Tharybis.
Annot. Source: Summary of text.

The systematic status of the calanoid family Tharybidae is discussed and a new genus, Parundinella is created. A synoptic key to the three genera (Tharybis, Undinella, Parundinella) in the family Tharybidae is presented and two species are described: Parundinella spinodenticula and P. manicula.

Geog. Loc.: Global.
Local Taxa: Eucalanus attenuatus, E. bungii, E. californicus.
Annot. Source: Modified author's abstract.

Methods for the study of bilaterally symmetrical, serially homologous sets of integumental organs comprising hair, peg, and pit sensilla and the pores of integumental glands as well as their number and distribution in the genus are described. Included is a provisional list of valid species and phylogenetic groupings in the genus Eucalanus with biogeographic assignment for each species based on records confirmed by the author.

Geog. Loc.: Global.
Local Taxa: *Euchaeta*.
Annot. Source: Summary of text.

The species *Euchaeta tonsa* was previously thought to have a cosmopolitan distribution. Closer examination of the literature and of specimens collected from a wide range of locations has identified two new species which are described in this paper. The geographic range of these three species is thought by the author to be as follows: *Euchaeta tonsa* being confined to the North Pacific; *Euchaeta pseudotonsa* n. sp. occurring only in the Atlantic Ocean; *Euchaeta scaphula* being found in the Indian Ocean and the East Indian Archipelago, as well as off Japan and in Monterey Bay, California. Some notes on the systematic status of the genus are included.

Local Taxa: *Oithona spinirostris, O. plumifera, O. helgolandica*.
Annot. Source: Modified author's abstract.

Quantitative sampling off the coast of Washington and British Columbia shows a regular seasonal variation of zooplankton volumes. Average volumes for the upper 100 meters of water varied from a winter minimum of 0.035 cc/m$^3$ in December 1956 to a maximum of 0.139 cc/m$^3$ in May 1957. The most numerous zooplankters were *Pseudocalanus minutus* (Kroyer) and *Oithona similis* Claus. The paper includes a brief discussion of taxonomic characters used to differentiate *Oithona spinirostris* from *O. plumifera*.

**Geog. Loc.:** North Atlantic and Arctic.
**Local Taxa:** *Calanus marshallae*.
**Annot. Source:** Author's abstract.

A morphometric analysis using certain taxonomic characters of adult males of *Calanus finmarchicus* (Gunnerus) and *C. glacialis* Jaschnov shows that the taxa comprise two non-overlapping clusters. *Calanus finmarchicus* and *C. glacialis* are probably reproductively isolated. Differences between the species in geographical distribution, vertical distribution, and timing of life cycles also support this conclusion. Previous taxonomic studies of adult females of the two species have yielded inconclusive results, probably because the analyses were based largely on subgeneric characters.

**Geog. Loc.:** Polar and boreal waters of the northern hemisphere.
**Local Taxa:** *Calanus marshallae*.
**Annot. Source:** Summary of text.

Close scrutiny of head, appendage, and genital segment shapes coupled with prosome lengths has identified a new species, *Calanus marshallae* in the *Calanus finmarchicus* species complex.
The genus Clausocalanus consists of small, holoplanktonic species of marine calanoid copepods. The principle difference between species is the formation of primary and secondary structures. All but two of the 13 species in this genus have a circumpolar distribution and many species co-occur. The paper includes a key to species, distribution patterns, species descriptions and illustrations as well as a discussion on patterns of morphological divergence.

A key to adult female copepods is based on total body length and shape for 46 species of calanoids and 4 species of cyclopoids. Tables are included which differentiate some naupliar and copepodite stages. No taxonomic descriptions are included. Under each entry in the species list is a list of references.

Geog. Loc.: France, northeastern Atlantic.
Local Taxa: Monstrilla helgolandica.
Annot. Source: Summary of text.

While observing a parasitic gastropod (Odostromia tissoides), on mussels, eight female specimens of Monstrilla helgolandica Claus and three previously unknown males of the same species were obtained. Both sexes of M. serricornis Sars, of which only the males are known, are thought to be synonymous with the newly described M. helgolandica male. The species M. serricornis therefore is regarded as a synonym of M. helgolandica.

Local Taxa: Rhincalanus nasutus, Eucalanus elongatus.
Annot. Source: Summary of text.

Nauplii from a sample taken in May 1929 at 59° 17' N, 6° 53' W were identified as Rhincalanus nasutus and Eucalanus elongatus. Both of these species emerge from the egg as Stage II nauplii. Since Rhincalanus nasutus nauplii had previously been described by Gurney (1934), only the discrepancies were noted. A complete description of stage II to stage VI Eucalanus elongatus nauplii is contained in the paper. Some illustrations are included.
The first two naupliar stages of the Atlantic species *Calanus finmarchicus* and *Metridia lucens* are virtually indistinguishable from each other. Nauplii III to V differ in the thickness and texture of the caudal spines. Nauplius VI of *Metridia lucens* was not located.

*Oithona helgolandica* is redescribed; *O. similis* is confirmed as a synonym. The occurrence of body spines on cyclopoid nauplii is discussed. Naupliar and copepodite stages of *O. helgolandica* and *O. spinirostris* are described.

Geog. Loc.: Vineyard Sound, northwestern Atlantic.
Local Taxa: Epilabidocera.
Annot. Source: Extracted from the text.

The post-embryonic development of Labidocera aestiva is described based on specimens reared in the laboratory. Sexual dimorphism first becomes apparent in the structure of the fifth swimming leg of copepodite IV.

Geog. Loc.: Central eastern Pacific.
Local Taxa: Chirundina streetsi, Gaidius pungens, Scottocalanus persecans, Lophothrix frontalis, Heterorhabdus tanneri.
Annot. Source: Summary of text.

An annotated species list of calanoid and cyclopoid copepods collected in the Central eastern Pacific by the Albatross in 1891 is given. Three new genera (Gaidius, Chirundina, Lophothrix) and ten new species are described.

Geog. Loc.: Canadian Arctic.
Local Taxa: Microcalanus pygmaeus, Calanus.
Annot. Source: Summary of text.

Zooplankton collections from the Arctic Ocean, the Beaufort Sea, and northwestern Canadian coastal waters are described, along with physical characteristics of the water samples. The 50 species identified can be subdivided into three groups: the surface waters of the Arctic Ocean, the deep layer of the surface waters of the Arctic Ocean, and the waters of the Atlantic Ocean. Development rates of two copepods, Microcalanus pygmaeus and Calanus glacialis, are discussed.

Geog. Loc.: Central Pacific.
Local Taxa: Calanoidea.
Annot. Source: Summary of text.

One hundred ten species of calanoid copepods collected in the central Pacific are discussed. Twenty-one of these are known to occur in British Columbia coastal waters. References to distribution, ecology, and diagnostic characters such as total body length are presented. Many species are illustrated.

Geog. Loc.: Northwestern Atlantic.
Local Taxa: Lucicutia ovalis.
Annot. Source: Modified author's abstract.

A list of 138 species of Copepoda from 15 deep plankton samples taken between 41°N and 15°N in the Atlantic Ocean is presented. The distribution of Calanus finmarchicus Gunnerus, C. helgolandicus (Claus), and Haloptilus longicirrus Brodsky are discussed. Isochaeta ovalis Giesbrecht and Lucicutia frigida Wolfenden are declared synonymous. Lucicutia ovalis Wolfenden has been renamed Lucicutia gaussae, nom. nov. because of homonymy.

Geog. Loc.: Woods Hole, northeastern Atlantic.
Local Taxa: Eurytemora americana.
Annot. Source: Summary of text.

Eurytemora americana and Eurytemora herdmani were reared through all life history stages from eggs collected at Woods Hole. All stages are briefly described and well figured.
Zooplankton observations made during two Atlantic crossings in 1897 include various species lists stating dates, times, and positions of collections. Distributional notes on copepods are discussed, with descriptions of three new calanoids (Corynura discapudatus, Acartia forcipata, Eurytemora herdmani), and one new cyclopoid (Pseudolichomolgus columbiae). A species list of plankton and dredged invertebrates is given in the appendix.

Heron, G.A. 1964. Seven species of Eurytemora (Copepoda) from northwestern North America. Crustaceana 7(3): 199-211.

Geog. Loc.: Northwestern Alaskan coast.
Local Taxa: Eurytemora americana, E. pacifica.
Annot. Source: Summary of text.

Seven species of Eurytemora (Copepoda: Calanoida) were collected close to the northwestern Alaskan coast during August 1959. Various body measurements were made along with notes on the external morphology of the specimens. Many illustrations are included.

Geog. Loc.: Antarctic waters.
Local Taxa: Oncaea englishi, O. prolata.
Annot. Source: Author's abstract.

Adult Oncaeidae found in five samples collected during a cruise of the V.S.N.S. Eltanin in the sub-Antarctic and Antarctic zones of the southwestern Pacific Ocean are listed including descriptions of 18 new species and 3 established species of Oncaea, two new species and one established species of Conaea, and two new species placed in a new genus, Epicalymma.

Local Taxa: Lubbockia wilsonae, Pseudolubbockia dilatata.
Annot. Source: Author's abstract.

Five species of Cyclopoida found in samples collected from 340 to 1275 meters in the Gulf of Alaska are considered. Lubbockia wilsonae, a new species, is described. Other descriptions are given for Lubbockia glacialis, Pseudolubbockia dilatata, Ratania atlantica and Pontoeciella abyssicola.

Local Taxa: Lubbockia minuta, L. wilsonae.
Annot. Source: Summary of text.

The family Oncaeidae and the genus Lubbockia are described, including descriptions of five new species: Lubbockia carinata, L. forcipula, L. flemingi, L. petersoni, and Lubbockia sp. Only fifth stage copepodites were obtained for Lubbockia sp. so a specific epithet was deferred. Five other species of Lubbockia are described and illustrated.

Geog. Loc.: Global.
Local Taxa: Lucicutia flavicornis, L. bicornuta.
Annot. Source: Author's abstract.

The genus Lucicutia is revised. Thirty-seven species within the genus are recognized and presented in a list with notes on synonymies and distribution. Six new species are diagnosed and additional descriptions given for certain other species. A key for the identification of the species of Lucicutia is included.

Geog. Loc.: Global.
Local Taxa: Macrocheiron sargassi.
Annot. Source: Summary of text.

A revision of the cyclopoid family Lichomolgidae and its associated genera is contained in this paper. Key to genera and species are included. All species are fully described and illustrated.

Geog. Loc.: Bristol Channel and Irish Sea, northeastern Atlantic.
Local Taxa: Monstrilla.
Annot. Source: Modified author's abstract.

The family Monstrillidae is here divided into three genera, Monstrilla Dana, Thaumaleus Kroyer and Monstrillopsis Sars. Fifteen species of monstrillid copepods are listed for the Bristol Channel and Irish Sea, of which six are new and are described here for the first time. There is some evidence that the pelagic stage of monstrillids may aggregate.
The seasonal abundance of different life history stages of *Calanus tonsus* in southeastern New Zealand waters from September to January is discussed. A review of the past confusion as to the identity and geographic distribution of *Calanus tonsus* and *C. plumchrus* is included.

All naupliar and copepodite stages of *Epilabidocera amphitrites* were collected or reared, and are described and illustrated in detail.

Geog. Loc.: North Pacific.
Local Taxa: Pachyptilus pacificus, Centraugaptilus porcellus.
Annot. Source: Summary of text.

Both sexes of Centraugaptilus porcellus and the female of Pachyptilus pacificus are described and illustrated. These two new species of bathypelagic marine copepods were identified from a sample collected at 49° 20' N, 174° 31' W in the north central Pacific.

Geog. Loc.: Northern Pacific.
Local Taxa: *Eucalanus bungii*.
Annot. Source: Modified author's summary.

A study of the distribution and biology of *Eucalanus elongatus* is hindered by the failure of authors to distinguish between the varieties of the species as set down by Giesbrecht (1892). It is suggested that the variety *bungii* should be raised to the rank of species and it is noted that some variation of the armature of the mandibular palp is evident within this variety. All the developmental stages of *Eucalanus elongatus* var. *bungii* from the first nauplius larva to the adult are described and illustrated.

Local Taxa: *Eucalanus bungii, Eucalanus californicus, Eucalanus*.
Annot. Source: Summary of text.

The external morphology, geographic distribution and breeding ranges of *Eucalanus elongatus* varieties are compared. Evidence is given to justify the creation of the following new species and subspecies: *Eucalanus bungii bungii, Eucalanus bungii californicus* and *Eucalanus inermis*. The above species are described and illustrated.

Geog. Loc.: Northern Pacific.
Local Taxa: Eucalanus bungii, E. californicus.
Annot. Source: Summary of text.

A hypothesis is proposed as to the possible species formation of Eucalanus bungii bungii and E. bungii californicus from the supposedly phylogenetically older species, E. elongatus. Mori's (1937) suggestion that E. bungii be called E. giesbrechti is seen by the author as being taxonomically incorrect.

Geog. Loc.: Pacific Ocean.
Local Taxa: Harpacticoida, Microsetella rosea.
Annot. Source: Modified author's summary.

The previously unknown males of the following species are described and illustrated in detail: Microsetella rosea (Dana) (a pelagic Harpacticoida), and Vettoria granulosa (Giesbrecht) and Corissa parva Farran (both Cyclopoida).

Local Taxa: *Eurytemora pacifica*, *Centropages abdominalis*.
Annot. Source: Summary of text.

Nine shallow lagoons bordering on the Chukchi Sea were monitored for water temperature, salinity and zooplankton populations. Observations are made on the salinity tolerances for the copepod species identified. Taxonomic notes on *Limnocalanus grimaldi*, *L. johanseni*, *Centropages abdominalis*, and *Eurytemora pacifica* are included, and a new species, *Eurytemora foveola* is described.

Geog. Loc.: Harvard University, Massachusetts.
Local Taxa: *Eurytemora affinis*, *E. americana*.
Annot. Source: Summary of text.

The life history and morphology of *Eurytemora affinis* is compared to the descriptions for *E. americana* and *E. herdmani* by Grice (1971). Ecological relationships are discussed.

Geog. Loc.: Coastal waters of British Columbia, northeastern.
Local Taxa: Spinocalanus brevicaudatus, Scaphocalanus brevicornis, Heterorhabdus tanneri, Azygokeras columbiae, Calanus marshallae, Metridia pacifica.
Annot. Source: Summary of text.

The distribution and life cycles of three bathypelagic copepods (Spinocalanus brevicaudatus, Scaphocalanus brevicornis and Heterorhabdus tanneri) as well as two interzonal species (Calanus glacialis and Metridia pacifica) in Bute and Jervis Inlets and the Strait of Georgia were investigated. The three bathypelagic species are redescribed as well as a new species, Comantenna columbiae.

Geog. Loc.: Bute Inlet, B.C., northeastern Pacific.
Local Taxa: Azygokeras columbiae.
Annot. Source: Author's abstract.

Azygokeras columbiae n.gen., n.sp. can be distinguished from other genera of Aetideidae by the asymmetrical first antennae of the male, the setation of the first two segments of the second antennal exopod of the female, and by the spinulation on basipods and rami of the swimming legs of both sexes. The animal was found only in deep hauls from Bute Inlet and is probably an epibenthic form.
Eggs from *Centropages abdominalis* were reared in the laboratory through all the naupliar stages within ten days of hatching in water at 15.4° C. All the naupliar stages are fully described and illustrated.

The occurrence and abundance of the 17 recognized subspecies and species of *Eucalanus* were investigated in plankton samples from more than 700 stations in the Pacific Ocean and Indo-Pacific region. The data are summarized in a series of distribution charts. Specific structural features of body form and appendages are illustrated, together with diagnostic keys and discussions of taxonomic status, synonymy, and geographical variation.

Geog. Loc.: Plymouth Laboratory, northeastern Atlantic.
Local Taxa: See note below.
Annot. Source: Summary of text.

The calanoid copepod, Calanus finmarchicus, was successfully reared from eggs to the adult. The first five naupliar stages and the five copepodite stages are described and illustrated in detail, but the 6th naupliar stage was missed. The adult, 6th copepodite, is not discussed.

Note: This paper is included here because the first five naupliar and copepodite stages of this species are similar to other members of this genus.

Local Taxa: Corycaeus anglicus.
Annot. Source: Summary of text.

Original descriptions are given for the following eight species of copepods: Calanus euchaeta, C. anglicus, Diaptomus bateanus, D. longicaudatus, Pontella wollastoni, Pontellina brevicornus, Corycaeus anglicus, Monstrilla anglica. The body of the text is written in English with the actual descriptions appearing in Latin.

Geog. Loc.: Gulf of St. Lawrence.
Local Taxa: Chiridius gracilis.
Annot. Source: Author's abstract.

On the basis of specimens taken from plankton samples, all copepodite stages of Chiridius gracilis are described and illustrated. The first thoracic somite is fused with the cephalosome in adults, but an incomplete suture exists between these body parts in copepodites IV and V. The metasomal process, a prominent character of this species, appears as a small blunt process as early as copepodite I and becomes fully developed by copepodite IV. Segmentation of mouthparts is complete by copepodite IV but full setation is not acquired until the adult stage. The mandible, maxillule, and maxilla degenerate in the adult male. Segmentation and setation of swimming legs are complete in copepodite V in the female and in the adult male.

Geog. Loc.: Coast of British Columbia.
Local Taxa: Corycaeus affinis, Epilabidocera longipedata.
Annot. Source: Summary of text.

Observations of phytoplankton and zooplankton from a 1912 cruise in Puget Sound and the Strait of Georgia are discussed. Brief mentions are made of Anthomedusae, Siphonophora and the more abundant Crustacea. One species of cyclopoid copepod, Corycaeus affinis, and one new genus and species of calanoid copepod, Paralabidocera amphitrites, are described.

Geog. Loc.: Passamaquoddy Bay, northwestern Atlantic.
Local Taxa: Monstrilla canadensis.
Annot. Source: Summary of text.

A new species of monstrilloid copepod, Monstrilla canadensis, is described from a single male specimen. Additional notes on other parasitic crustaceans are also discussed.

Geog. Loc.: Northern waters of Japan.
Local Taxa: Neocalanus plumchrus, Euchaeta elongata.
Annot. Source: Summary of text.

One hundred sixty-four plankton species were identified from samples taken from May to October 1915 in the North Pacific, and the Okhotsk and Japan Seas. The following four species of calanoid copepods are described for the first time: Calanus plumchrus, Eucalanus oculanus, Euchaeta japonica, and Pseudolovenula magna.

Geog. Loc.: Coastal waters of Japan, northwestern Pacific.
Local Taxa: Calanoida, Cyclopoida, Harpacticoida.
Annot. Source: Summary of text.

An identification key to 179 species of pelagic marine calanoid, cyclopoid and harpacticoid copepods is given. Thirty-two of these are found in British Columbia coastal waters. Most species are described and illustrated. Ten species are new to science.

Geog. Loc.: North Pacific (160°E).
Local Taxa: Gaidius pungens.
Annot. Source: Author’s abstract.

Ninety-nine species of calanoid copepods were identified from 29 midwater-trawl samples taken at ten stations in the subarctic, transitional, and subtropical regions of the North Pacific. Fourteen species are discussed, including the previously unknown male of Gaidius pungens and three species in the Scottocalanus helenae group. There are nine new records of species from the study area.

Geog. Loc.: North Pacific.
Local Taxa: Mesocalanus tenuicornis.
Annot. Source: Summary of text.

The geographical and vertical distribution, reproductive cycles and character displacement in body size and mouthparts of the sibling species Calanus tenuicornis and C. lighti in the North and South Pacific were investigated. Bowman's (1955) descriptions were found to be adequate in making a clear distinction between the two species in most of the Pacific. An intermediate form was found in the South Pacific at latitudes higher than 40°. Calanus lighti was concluded to be an ecophenotype of C. tenuicornis since the 'pure' forms were absent in the area in which it occurs.

Geog. Loc.: Scripps Institute, California, northeastern Pacific.
Local Taxa: Oithona.
Annot. Source: Summary of text.

Oithona nana was reared through two generations in the first successful culture of a marine copepod. Average body length and duration of each stage is recorded. Sexual differentiation was possible after the third naupliar stage. A key to naupliar and copepodite stages is included.
A new species of calanoid copepod, *Euchirella tanseii*, is described. The species closely resembles *Euchirella venusta* Giesbrecht and *E. pulchra* (Lubbock), but can be distinguished by the shape of the genital segment and the number of setae on the 2nd segment of the endopodite of the second antenna. A comparison of systematic characters of these species is attempted.

The primary dichotomous key in this book differentiates the many genera of calanoid, cyclopoid and harpacticoid copepods inhabiting the Florida current. Secondary keys to species are arranged in taxonomic order and include distributional notes for each species. All the keys are illustrated with line drawings and/or photographs.
Particular emphasis is placed on the internal anatomy and functional morphology of *Epilabidocera amphitrites*. The external anatomy of both the female and male are described in detail.

Geog. Loc.: Saanich Inlet, B.C., northeastern Pacific.
Local Taxa: *Bradyidius saanichi, B. similis*.
Annot. Source: Author's abstract.

A new species, *Bradyidius saanichi*, from Saanich Inlet Vancouver Island, British Columbia, is described and illustrated. This species is closely related to *B. pacificus* (Brodsky, 1950). It can readily be distinguished from the latter by the strongly divergent rostral rami, in addition to other differences.
All aspects of the biology of an adult calanoid copepod, *Epilabidocera amphitrites*, are discussed. Included are detailed taxonomic descriptions and drawings of the adult male and female. The juvenile forms are not discussed.

Three species of *Monstrilla* from the Strait of Georgia, British Columbia, are described and illustrated in detail. Two of these, *M. wandelii* Stephensen and *M. helgolandica* Claus, have not previously been reported from this area, and the male of the former is here described for the first time. The other species, *M. spinosa*, is new.

Geog. Loc.: Strait of Georgia, B.C., northeastern Pacific.
Local Taxa: Gaidius minutus, Tharybis fultoni.
Annot. Source: Author's abstract.

Two new species, Gaidius columbiae and Tharybis fultoni, from the Strait of Georgia, British Columbia, are described and illustrated in detail. The former can be distinguished from all previously known species of its genus by the shape of the postero-lateral process of the metasome, and the latter by the shape of the 5th pair of legs.

Geog. Loc.: Central North Pacific.
Local Taxa: Calanoida, Euchaeta media.
Annot. Source: Summary of text.

A collection of 64 species of calanoid copepods was obtained from the central North Pacific Ocean. Of these, 20 species are known to occur in British Columbia coastal waters. Remarks on distribution, total body length and diagnostic characters are included for each species. The male of Euchaeta media is redescribed and two forms of adult and stage V copepodite Eucalanus attenuatus are described at length. Many drawings are included in the text.

Geog. Loc.: Washington Sound, Washington, Strait of Georgia and Queen Charlotte Islands, B.C., northeastern Pacific.
Local Taxa: Gaetanus intermedius, G. simplex, G. minor, G. armiger.
Annot. Source: Author's abstract.

Gaetanus intermedius Campbell, 1930, is redescribed from specimens taken in the type locality, the Vancouver Island region in the northeastern Pacific. Gaetanus simplex Brodsky, 1950 is found to be a junior synonym of G. intermedius.

Geog. Loc.: Gulf of Mexico.
Local Taxa: Gaetanus intermedius, G. miles, G. pileatus, Gaidius minutus, G. pungens, G. variabilis.
Annot. Source: Modified author's abstract.

The union of the genus Gaidius Giesbrecht with Gaetanus Giesbrecht is proposed, with a brief review of all the species so far described for the genera. Ten species of Gaetanus collected from the Gulf of Mexico are described and illustrated. The males of G. armiger, G. brachyurus, G. latifrons, G. miles, G. minor and G. minutus are described here for the first time. A key to the species of Gaetanus from the Gulf of Mexico is given.

Geog. Loc.: Gulf of Mexico.
Local Taxa: Chiridius gracilis.
Annot. Source: Modified author’s abstract.

Descriptions and illustrations are given for calanoid copepods of the genera Aetideopsis, Pseudaetideus, and Chiridius found in the Gulf of Mexico, including two new species of Chiridius (C. subgracilis and C. mexicanus). The genus Pseudaetidius is considered synonymous with Aetideopsis.

Local Taxa: Euchirella pseudopulchra, E. pulchra.
Annot. Source: Summary of text.

Specimens of Euchirella pulchra from Washington Sound, Gulf of Mexico, Caribbean Sea, Canary Island area, and Gulf of Guinea were examined, resulting in the recognition of the northeastern Pacific population as being distinct from the others. A new species, E. pseudopulchra, is described for the first time. Euchirella pulchra is redescribed for characters useful in distinguishing it from the new species.

Geog. Loc.: Gulf of Mexico.
Local Taxa: Euchirella rostrata, E. pulchra, E. curticauda.
Annot. Source: Modified author's abstract.

During the examination of 93 zooplankton tows taken from various depth ranges between the surface and 3000m, 5622 specimens belonging to nine Euchirella species were found. Each of these species is described and illustrated. The relative abundance and bathymetrical distribution of each species by day and night are briefly discussed. A key to the species is given.

Geog. Loc.: Coast of California, northeastern Pacific.
Local Taxa: Euchaeta californica.
Annot. Source: Summary of text.

Euchaeta californica is redescribed from Esterly's type specimen and from other specimens from the type area. Euchaeta dubia is considered to be the male of E. californica and is so described. The synonymy of the species is summarized, including references to E. californica and E. dubia which are considered to be incorrect.
Sub-Antarctic and Antarctic calanoid copepods belonging to the families Aetideidae and Euchaetidae are the subject of this key. Sixty-two species representing 13 genera are described and illustrated from specimens collected in sub-Antarctic and Antarctic waters. Twelve species are described for the first time.

Seventy-four Issac-Kidd midwater trawls and 66 bongo plankton net samples from Antarctic and sub-Antarctic waters have been examined for the calanoid genus Scolecithricella. Nineteen species are new to science, two species are new records to the area, and three species represented solely by males are not identified. All species are characterized with descriptions and illustrations. Keys are presented for identification of the species.
The pelagic marine calanoids, harpacticoids, cyclopoids, and monstrilloids of the northeastern Atlantic are reviewed. Keys and taxonomic descriptions are given for the order, family, genus and species levels. Forty-eight of the species discussed occur in British Columbia coastal waters.

Descriptions and illustrations of pelagic marine calanoid copepods collected in Norwegian waters are given, with many of the genera and species being described for the first time. No identification keys are included.
A species list of 79 calanoid copepods is given. Of these, five genera and 30 species are new to science and have been described. No illustrations are included.

Thirty-one species of calanoid copepods are described but not illustrated. Earlier taxonomic decisions are revised.

Local Taxa: Oithona spinirostris, O. similis, Macrocheiron sargassii.
Annot. Source: Summary of text.

A species list, including synonymies, of cyclopoid, harpacticoid and monstrilloid copepods obtained from expeditions of the Prince Albert de Monaco is presented. Only new genera and species are described and illustrated.

Geog. Loc.: Northeastern Atlantic.
Local Taxa: Oithona spinirostris, O. similis, Corycaeus anglicus, Oncaea borealis, Macrocheiron sargassii.
Annot. Source: Summary of text.

Descriptions and illustrations of pelagic marine cyclopoid copepods collected in Norwegian waters are given. Many of the genera and species are described for the first time. No identification keys are included.

Geog. Loc.: Northeastern Atlantic.
Local Taxa: Pseudochirella, Heterostylites, Centraugaptilus.
Annot. Source: Summary of text.

Thirty-four rare species are described and nine new genera erected, but no illustrations are included.

Local Taxa: Spinocalanus brevicaudatus.
Annot. Source: English summary.

On the basis of morphological analyses of the material collected in the waters surrounding Newfoundland (Grand Banks), and in the southern Norwegian Sea, the author suggests changes in the diagnostics and description of the species Spinocalanus brevicaudatus.
A compilation of the literature published prior to 1970 on marine zooplankton of Canadian waters is presented in three sections: Atlantic, Pacific, and Arctic, each containing records of species and a bibliography. An integrated index of generic and specific names for all three regions is included.

Geog. Loc.: Adriatic Sea.
Local Taxa: Oncaea ivlevi.
Annot. Source: English summary.

Four new species, Oncaea ivlevi, O. prendeli, O. zernovi, and O. ovalis from the south Adriatic Sea are described. The depth, temperature and salinity at which these copepods were found are mentioned.

Geog. Loc.: Adriatic Sea.
Local Taxa: Oncaea ivlevi.
Annot. Source: Modified English Summary.

Descriptions are given for eleven new species of Oncaea collected during plankton sampling of the U.S.S.R. RV Kristall (1958) and the Akademy Kovolevsky (1959, 1960) in the Adriatic Sea. Descriptions include collection stations and depths. Also given is a key to all known species of the genus Oncaea from the Mediterranean.
Tanaka, O. The pelagic copepods of the Izu Region, Middle Japan. Publications of the Seto Marine Biological Laboratory. Various issues (see below).

Geog. Loc.: Izu Region, Middle Japan.
Local Taxa: Calanoida.
Annot. Source: Summary of papers.

In an extensive series of publications, the author has revised and described all the known species of calanoid copepods occurring in the Izu Region. Detailed taxonomic drawings accompany each species description.

The list of these publications is as follows:

1964a. The pelagic copepods of the Izu Region, Middle Japan. 

1964b. The pelagic copepods of the Izu Region, Middle Japan. 

1964c. The pelagic copepods of the Izu Region, Middle Japan. 
Systematic Account XII. Families Arietellidae, Pseudocyclopidae, 

Tanaka, O., and M. Omori. 1968. Additional report on calanoid copepods from 
Lab. 16(4): 219-261.

Tanaka, O., and M. Omori. 1969a. On Euchirella (Copepoda, Calanoida) 
collected chiefly by the U.S. Steamer 'Albatross' from the Pacific Ocean. 

Tanaka, O., and M. Omori. 1969b. Additional report on calanoid copepods from 

Tanaka, O., and M. Omori. 1970a. Additional reports from the Izu Region. Part 
3-A. Eugetidius, Aetideopsis, Chiridius, Gaidius and Gaetanus. Publ. Seto 

Tanaka, O., and M. Omori. 1970b. Additional reports from the Izu Region. Part 
3-B. Chirundina, Undeuchaeta, Pseudeuchaeta, Valdiviella and Chiridiella. 

Tanaka, O., and M. Omori. 1971. Additional report from the Izu Region. Part IV. 
Haloptilus, Augaptilus, Centraugaptilus, Pseudaugaptilus, and Pachyptilus. 

Tanaka, O., and M. Omori. 1974. Additional report on calanoid copepods from 
193-267.

Geog. Loc.: Sizuoka-Ken, northwestern Pacific.
Local Taxa: Clausocalanus arcuicornus, Ctenocalanus vanus, Chiridius gracilis, Heterorhabdus papilliger.
Annot. Source: Summary of text.

The genus Paratharybis is erected for P. frontalis, and two new species, Xanthocalanus media and Scaphocalanus minuta, are described from a vertical haul from 500 to 250 m. Twenty-one species were identified.

Local Taxa: Neocalanus plumchrus.
Annot. Source: Author's synopsis.

Immature specimens of Calanus tonsus Brady are described.

Geog. Loc.: Antarctic waters, northern Pacific.
Local Taxa: Neocalanus plumchrus.
Annot. Source: Author's abstract.

Calanus plumchrus is shown to be distinct from C. tonsus Brady, and is described as a characteristic copepod of the North Pacific.

Geog. Loc.: Pacific Ocean.
Local Taxa: Lophothrix frontalis.
Annot. Source: Summary of text.

During the re-examination of specimens from the Wilson collections (U.S.N.M.), 17 species of calanoid copepods other than Euchirella were found from 46 vials labelled as Euchirella. Three species, Gaetanus minispinus, Scottocalanus infrequens, and Wilsonidius alaskaensis, are new to science and have been described. An immature Lophothrix frontalis male was found and its fifth legs have been illustrated.
Thorpe, A.C. 1980. Comparative morphology of sibling species of Metridia: 
(Copepoda: Calanoida) M. lucens, M. pacifica and a species indeterminata 
Vancouver.

Geog. Loc.: Indian Arm, B.C., northeastern Pacific.
Local Taxa: Metridia lucens, M. pacifica.
Annot. Source: Summary of author's abstract.

Metridia lucens from the northwestern Atlantic is compared 
with M. pacifica from the northeastern Pacific. The fifth pair of legs on 
adult males and females were examined and findings indicate errors in the 
original description of both species. Both these species are redescribed and 
illustrated as is a Metridia sp. collected from Indian Arm.

Geog. Loc.: Newport Bay, California, northeastern Pacific.
Local Taxa: Acartia californiensis.
Annot. Source: Summary of text.

Both the male and female of a new species of calanoid copepod, 
Acartia californiensis, is fully described and illustrated.

Geog. Loc.: Global.
Local Taxa: Onchocalanus magnus.
Annot. Source: Summary of text.

The genus Onchocalanus is discussed and a key to adult females of the eight known species is presented. Two species are described for the first time (O. scotti, O. wolfendeni), four are redescribed (O. cristatus, O. magnus, O. affinis, O. trigoniceps) and two are discussed briefly (O. subcrinitatus, O. hirtipes).

Geog. Loc.: Southeastern Atlantic.
Local Taxa: Various.
Annot. Source: Summary of text.

An extensive collection of pelagic copepods was obtained from the waters bordering tropical West Africa. This report deals with the taxonomy of the calanoid copepods from the families Calanidae through Euchaetidae, and includes remarks on synonymies, distributional records and taxonomic problems. Fifteen species found in British Columbia waters are included.

Geog. Loc.: Southeastern Atlantic.
Local Taxa: Various.
Annot. Source: Summary of text.

This report concludes the description of the Calanoida begun in Part I. Twenty-four species found in British Columbia waters are included.

Geog. Loc.: Central Arctic Ocean.
Local Taxa: Calanoida.
Annot. Source: Modified author's abstract.

All species known from the central Arctic Ocean, including new taxa, are keyed and illustrated, but no species descriptions are provided in this work intended for the non-specialist.

Geog. Loc.: Canadian Arctic, British Columbia coastal waters, northeastern Pacific.
Local Taxa: Centropages abdominalis, Eurytemora pacifica.
Annot. Source: Summary of text.

Distributional and some taxonomic information on the 33 identified species is presented. The following species are described for the first time: Centropages mcmurrichi, Eurytemora johanseni, Acartia tumida, and Thaumaleus bernardensis.

Geog. Loc.: Narragansett Bay, R.I., northwestern Atlantic.
Local Taxa: Eurytemora americana.
Annot. Source: Summary of text.

Twenty-six free-swimming copepods, one parasitic form, and a metanauplius of a parasitic copepod are described. Samples were taken during the summer and winter from the Narragansett Bay region. Three new species, Pseudodiaptomus coronatus, Eurytemora americana, and Tortanus setacaudatus are described and illustrated.

Geog. Loc.: Global.
Local Taxa: Various.
Annot. Source: Summary of text.

Listed are 472 species of pelagic marine copepods collected during seven voyages of the steamship Albatross between 1887-1910. The format is not that of a systematic treatise but rather an alphabetical listing of each species giving synonyms and collection stations, followed by some general notes on distribution and abundance. Twenty-nine new species are described and illustrated.

Geog. Loc.: Global.
Local Taxa: Acartia.
Annot. Source: Summary of text.

Acartia negligens is named as the type species of Acartia, of which Planktaacartia is a junior synonym.

Geog. Loc.: English Channel, northeastern Atlantic.
Local Taxa: Calanus.
Annot. Source: Author's summary.

A method for separating the sexes in the stage-V copepodite of *Calanus helgolandicus*, by examination of the proximal segment of the urosome, is suggested. In potential females, the ventral surface of the segment is more markedly curved, and the curve extends further forward than in potential males. Biometrical separation also revealed two groups within the stage-V copepodites, and the very close agreement obtained between this method and the urosome method of separation suggested strongly that the two groups described were indeed potential males and females. No geographical or seasonal variation in the biometrical ratios were found in the North Sea samples examined.

Geog. Loc.: North Sea.
Local Taxa: Calanus.
Annot. Source: Author's abstract, in part.

Population differences in measurements made on *C. helgolandicus* both in the English Channel and in the North Sea are used to confirm a method for separating the sexes of *C. helgolandicus* in Stage V by examination of the urosome. A similar method for the separation of the sexes in Stage V of *C. finmarchicus* is described, then used to determine the sex ratio in this stage, and to achieve an estimate of the duration of the fifth copepodite stage in the North Sea.

Local Taxa: Calanus pacificus, C. marshallae.
Annot. Source: Modified author's abstract.

A general account is provided of the distribution and ecology of C. glacialis and C. pacificus californicus from Glacier Bay, Alaska to the Mexican border. The two species are differentiated based on the following morphological characteristics: overall length, shape of anterior surface of cephalothorax, and differences in urosome and fifth legs. Detailed analysis of ecological relationships between the two species in Indian Arm, Vancouver, B.C., indicates spatial and temporal separation of breeding populations, confirming that despite range overlaps, the two species are distinct.

Geog. Loc.: Eastern Canadian Arctic.
Local Taxa: Pseudocalanus.
Annot. Source: Modified author's abstract.

Two forms of the copepod Pseudocalanus, which differ only in size, coexist in two semi-landlocked fiords on Baffin Island. The larger form possesses the same number of chromosomes as the smaller, but the chromosomes are larger and contain about seven times as much DNA. This larger form has a greater cell size, slower development rate, and later maturity, possibly representing an evolutionary attempt to restore normal arctic size and development rate in cold water fiords. Although this larger polytene form may be a new species, no name is given due to the indefinite taxonomy of the genus.

Geog. Loc.: Western Seas of Kyushu Island, Japan, northwestern Pacific.
Local Taxa: Calanus pacificus.
Annot. Source: Modified English summary.

Specimens identified as Calanus helgolandicus in the study area are attributed to C. pacificus var. japonicus. Two other varieties of C. pacificus were not found.
